Barnegat Bay Partnership Ecosystem Modeling Workshop

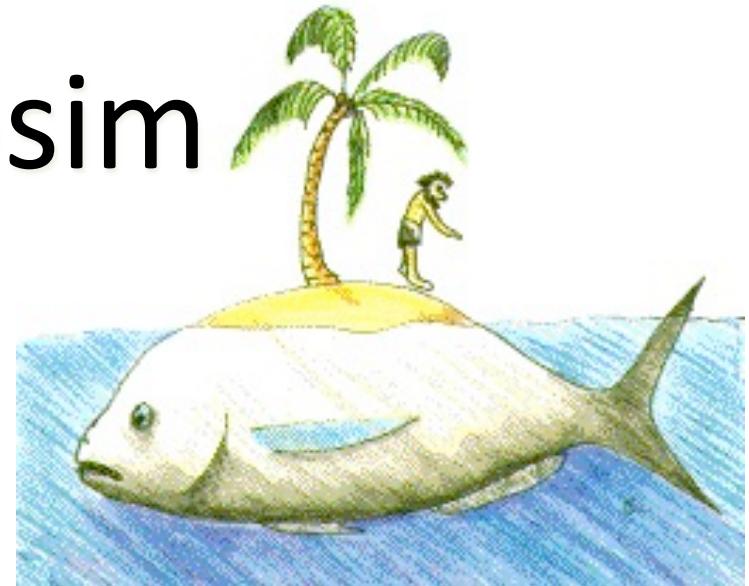

Ocean County College, Toms River, New Jersey

March 12-15, 2012

Ecopath with Ecosim

- *Software system*
- *Open source-code*
- *Freely available*
- www.ecopath.org

Ecopath: Mass-balance book-keeping

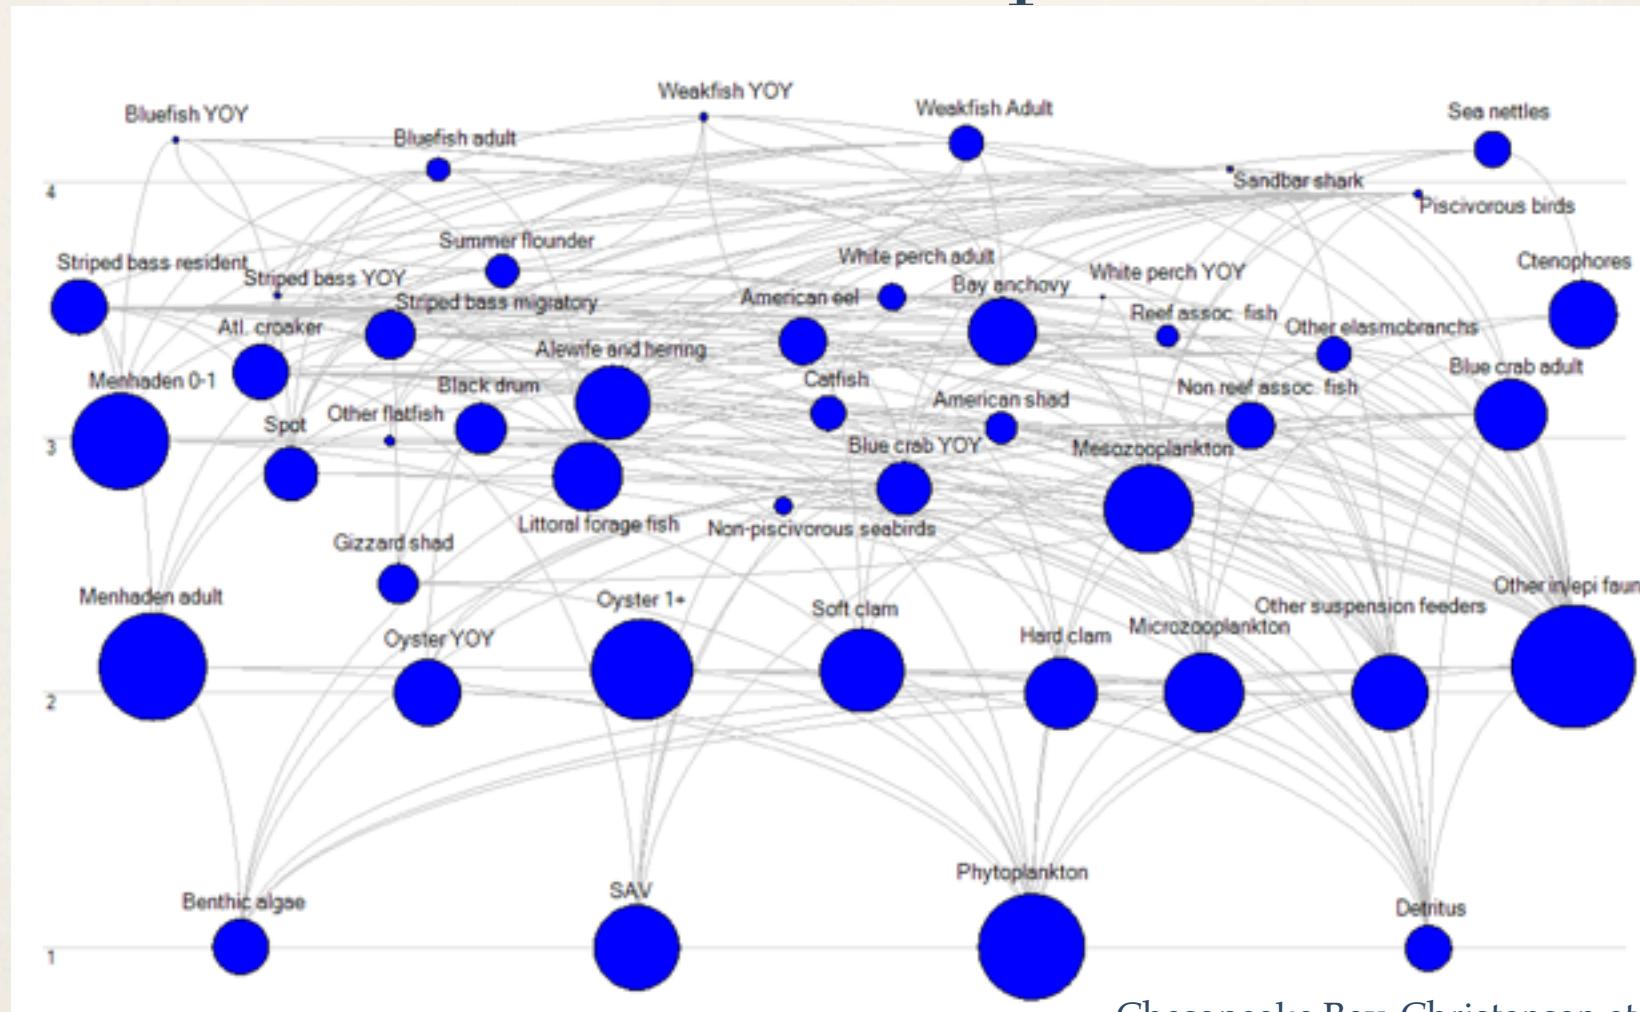

Ecosim: Time-dynamics, policy
exploration modules, MSE, ...

Ecospace: Spatial- and time-dynamics

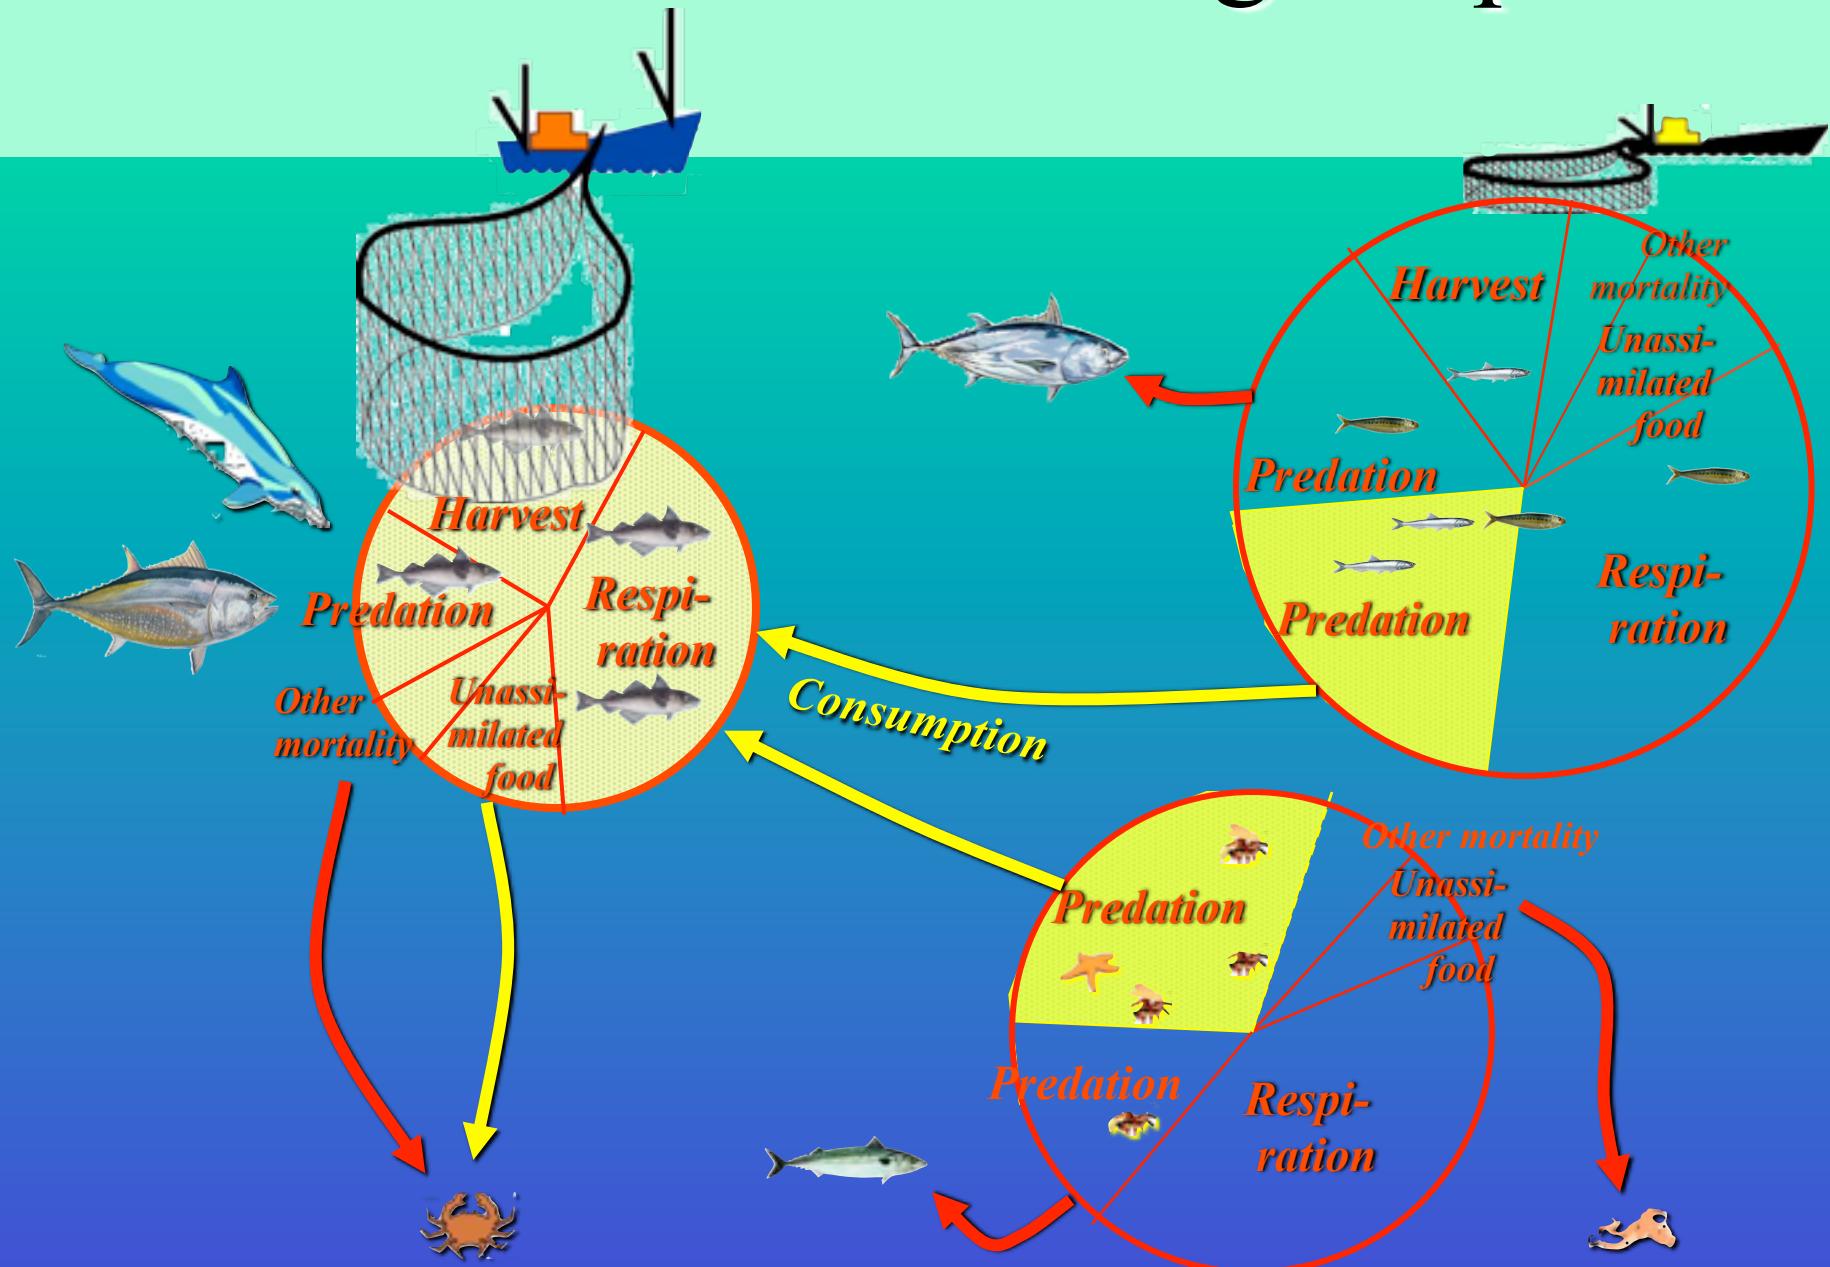

Ecotracer: Tracking persistent pollutants

Ecopath food web model: a snapshot of the ecosystem state, interactions, and exploitation

Trophic level

Mass balance: cutting the pie

EwE data, models, and uses

Abundance, mortality, catches, feeding rates diets, growth, interaction terms, carrying capacity, persistent pollutants, habitats, nutrient loading, climate indicators, migration, dispersal occurrence, distribution, costs, subsidies, prices, values, ecosystem services, employment

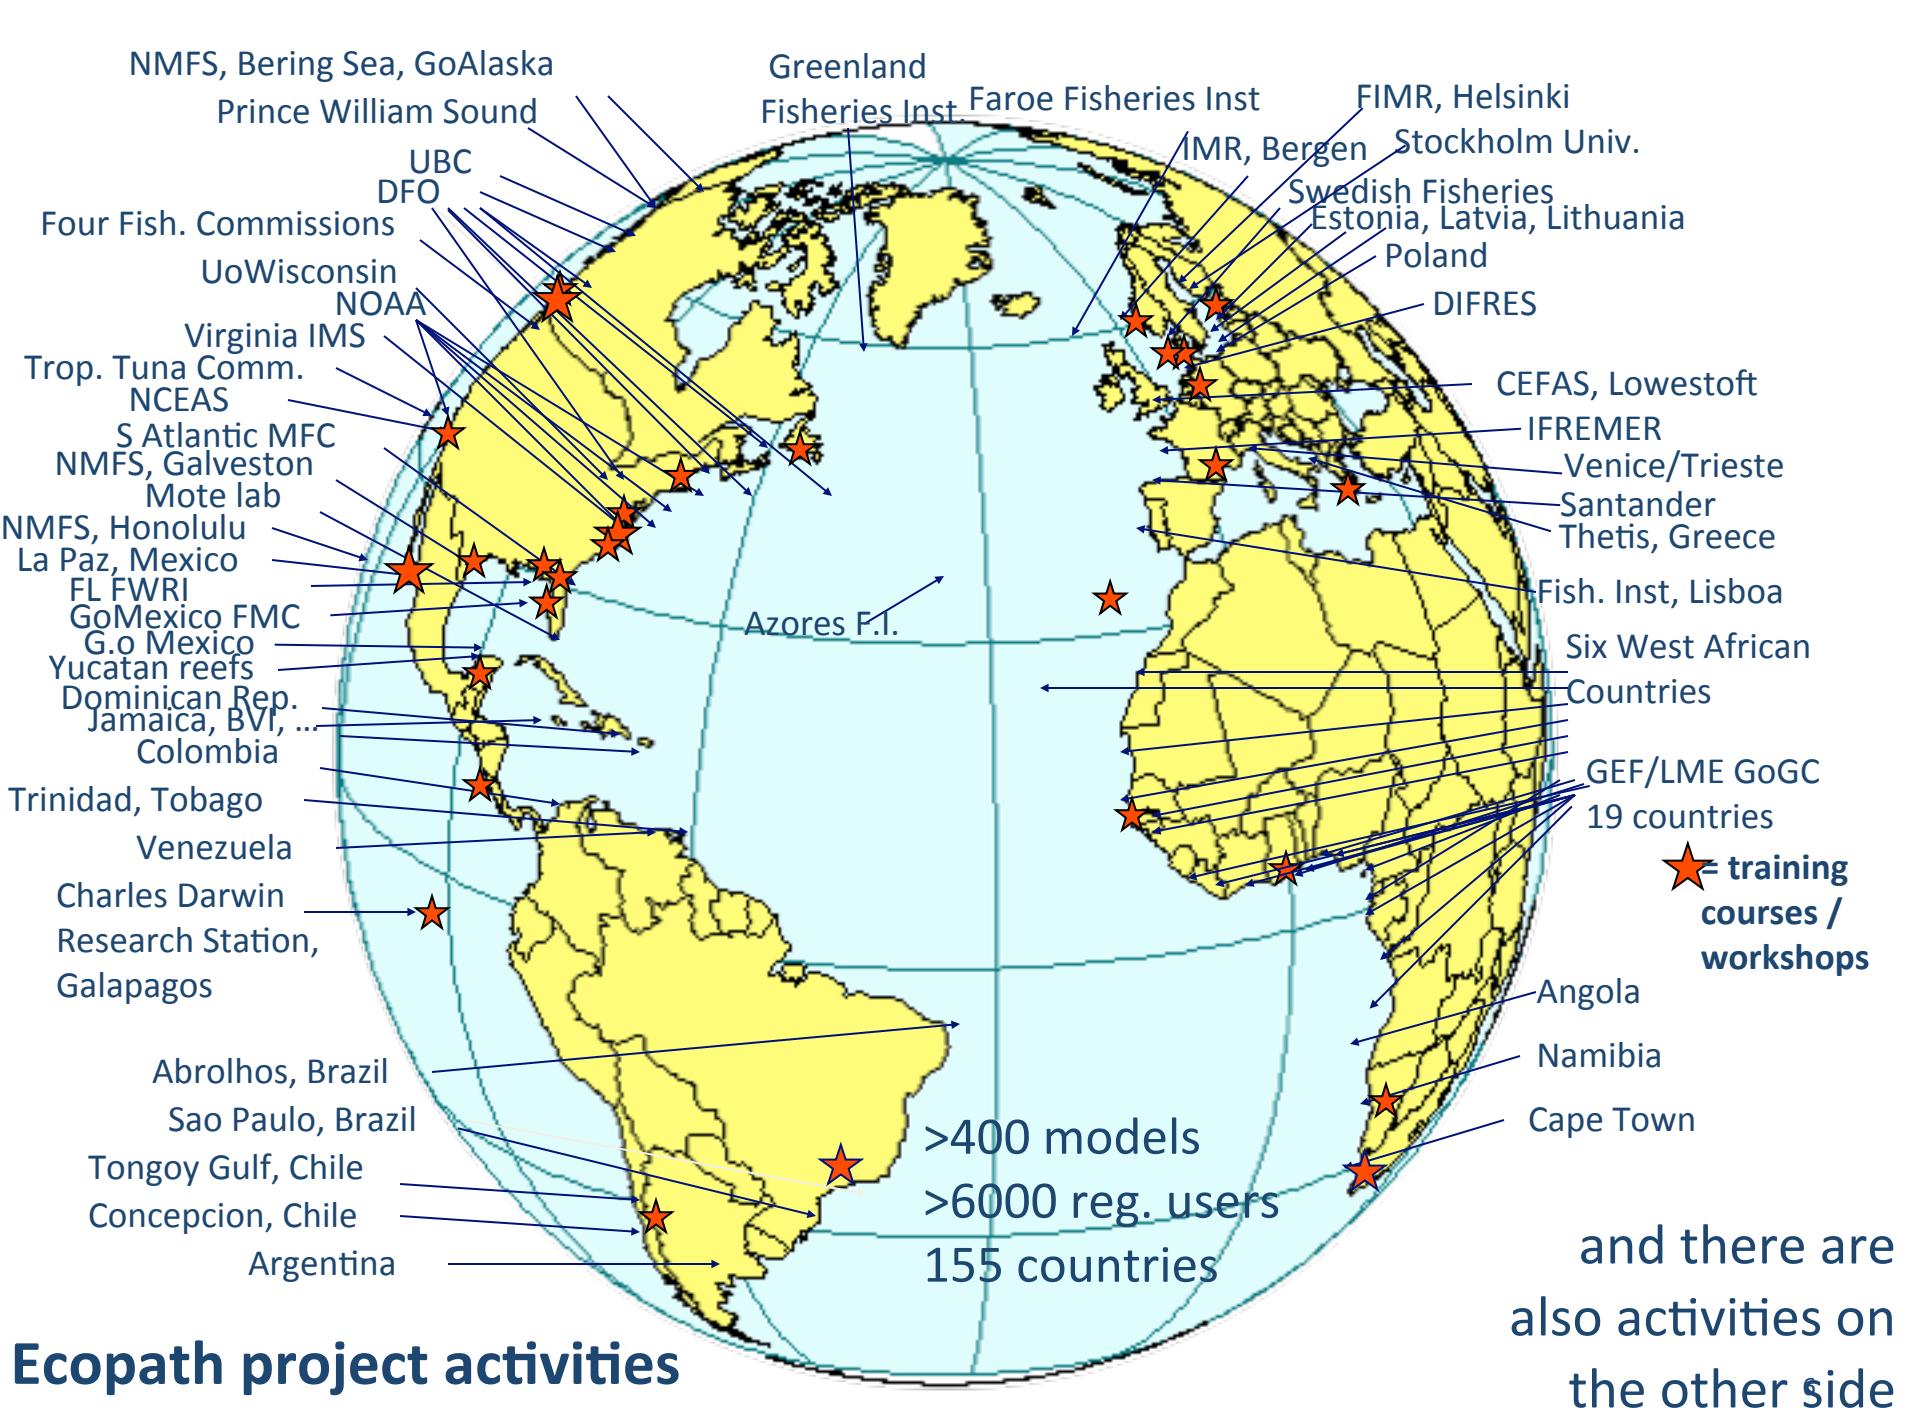

Parameterization
Ecopath

Time-dynamics
Ecosim

Spatial-dynamics
Eospace

Persistent pollutant dynamics

Environmental assessments, network analysis, ecological theory, fisheries management, adaptive management, culling, ecosystem manipulation, protected areas, spatial zoning, policy exploration, fisheries sector optimization, conflict reduction, climate scenarios, MEA, GEO4&5, gaming, ...

[Top Tens: The Breakthroughs](#)

The Breakthroughs

"The [ECOPATH] model's simplicity and its ability to accurately identify ecological relationships have revolutionized scientists' ability worldwide to understand complex marine ecosystems."

"In the late 1960s, NOAA's Geophysical Fluid Dynamics Laboratory ...developed the first-of-its-kind general circulation climate model that combined both oceanic and atmospheric processes. Scientists were now able to understand how the ocean and atmosphere interacted with each other to influence climate."

"While ecologists have long studied and taught the concept of ecosystems, the concept of large marine ecosystems is a breakthrough in understanding how best to manage large ocean areas for sustained biological productivity."

Multibeam sonar (illustrated below the ship) was a major breakthrough in hydrographic surveying. Data acquired with multibeam sonar have revolutionized human understanding of the seafloor and the efficiency of NOAA's Office of Coast Survey offshore surveying.

but

Technical status of EwE(5)

- Under development for 17 years by 2006
- Visual Basic 6 (*1998,+2005)
- Technically reached limitations
 - Notably with regards to linking to other models/modules & modelers
- Move to object-oriented environment
- Scary part: overhauling a scientific software often equates to killing it

Status

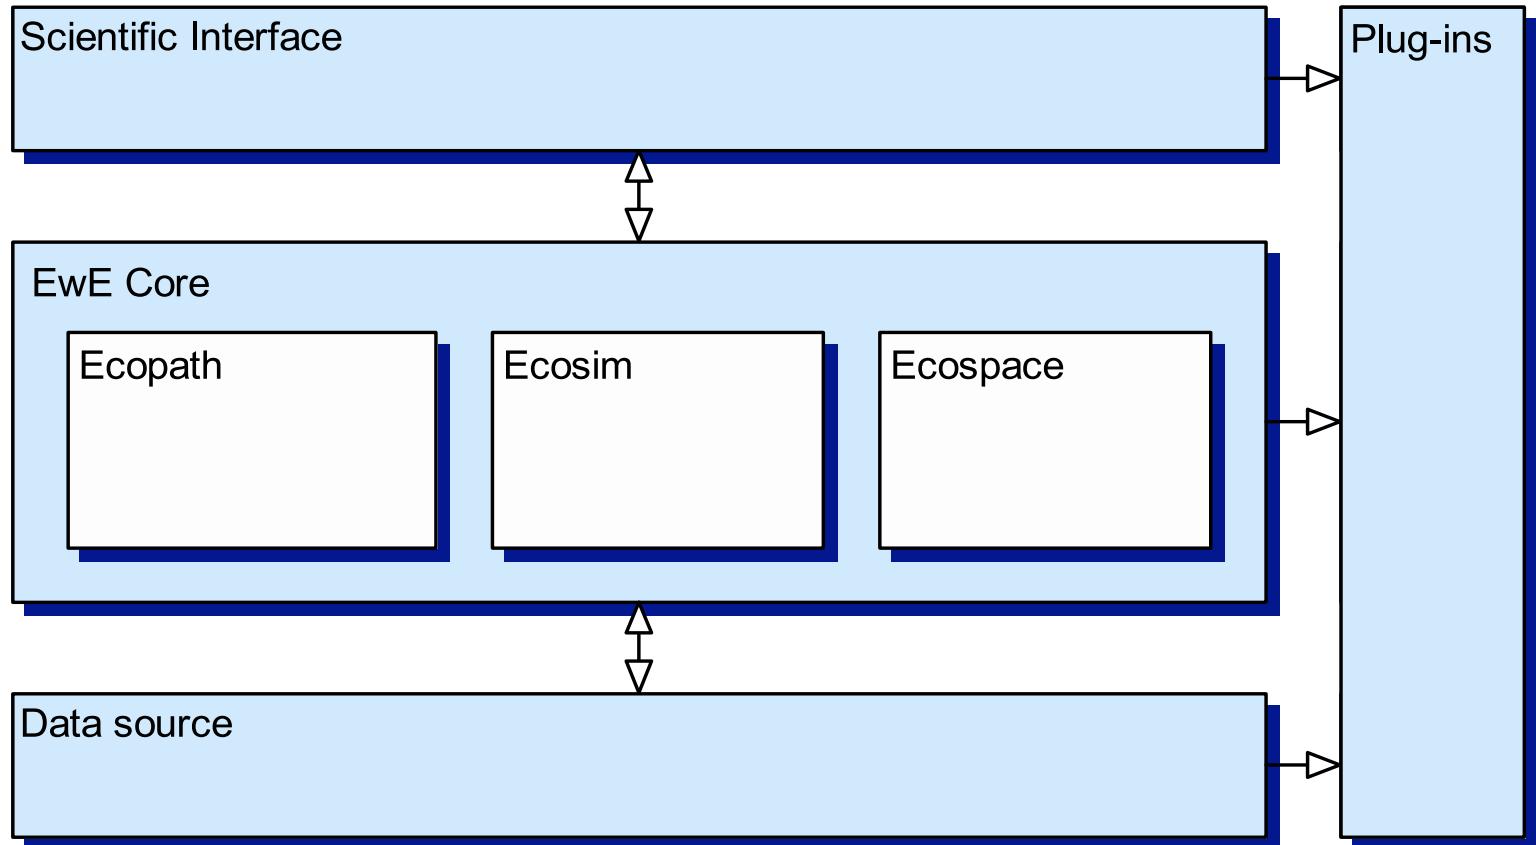

- Ecopath model 'Provider=Microsoft.Jet.OLEDB.4.0; Data Source=C:\Documents and Settings\w.christensen\AERL\Desktop\EwE6_Tampa_Bay.mdb' loaded.
- Ecopath run completed.
- Ecosim scenario 'TampaBay Flabay Nut better fix seagrass' loaded.
- Ecosystem scenario 'TampaBay Nut' loaded.

Status Remarks

Tampa Bay: modified TampaBay Flabay Nut better fix seagrass New scenario

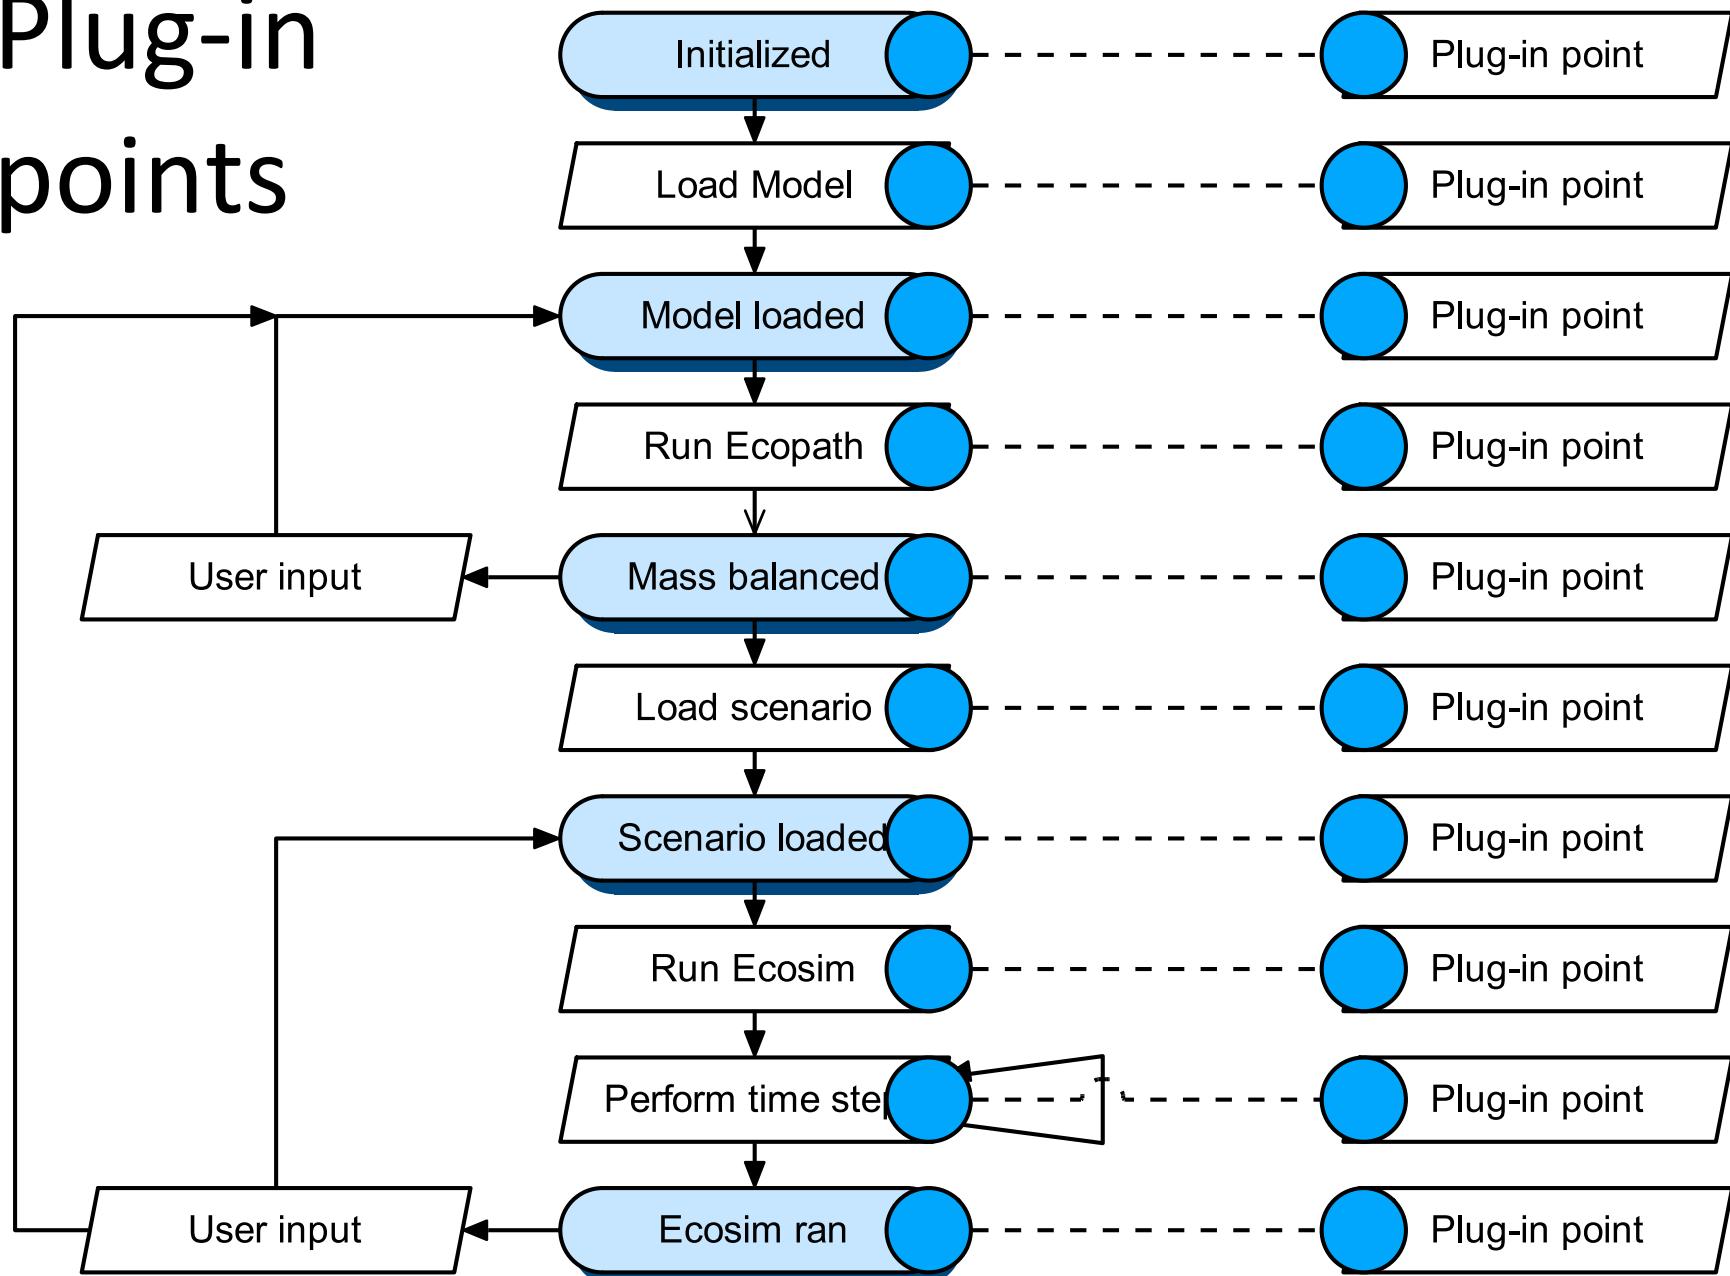

EwE6 overview

Source code (live) available for download through cvs

Plug-in points

Extending EwE: With plugins you can

- Add variables to models
 - Add calculations to models
 - Change calculations in models
 - Add user interface elements
 - Change existing user interfaces
-
- *Use EwE output elsewhere*
 - *Use other data as inputs for EwE*

Climate – GCM – EwE linkages

- | | |
|------------------|----------------------------------|
| → Salinity | ↔ Detritus dynamics |
| → Temperature | ↔ Primary producer dynamics |
| → O ₂ | ↔ First-order consumer dynamics |
| → pH | |
| → Nutrients | ← Second-order consumer feedback |
| → Advection | |

EwE model linkages: work in progress

- ROMS and climate models - EwE

Ecopath Consortium

- Initiated in 2011
- Currently has ~10 institutions as members (20 expected in 2012)
- Arranges support (subscription through the Consortium)
- Coordinates R&D

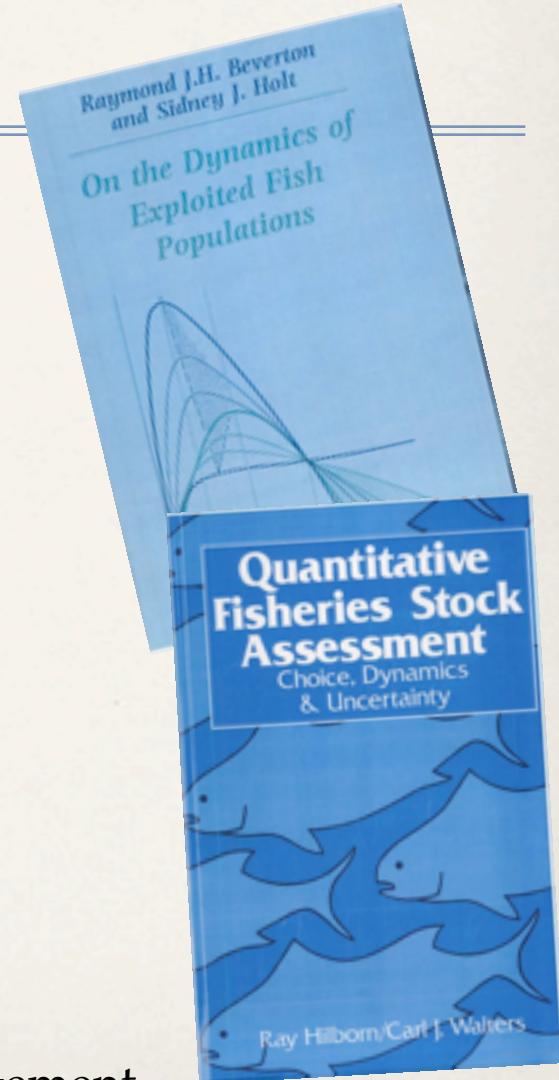

Oceanography and fisheries

- Who did it?
- What drives change in ecosystems?

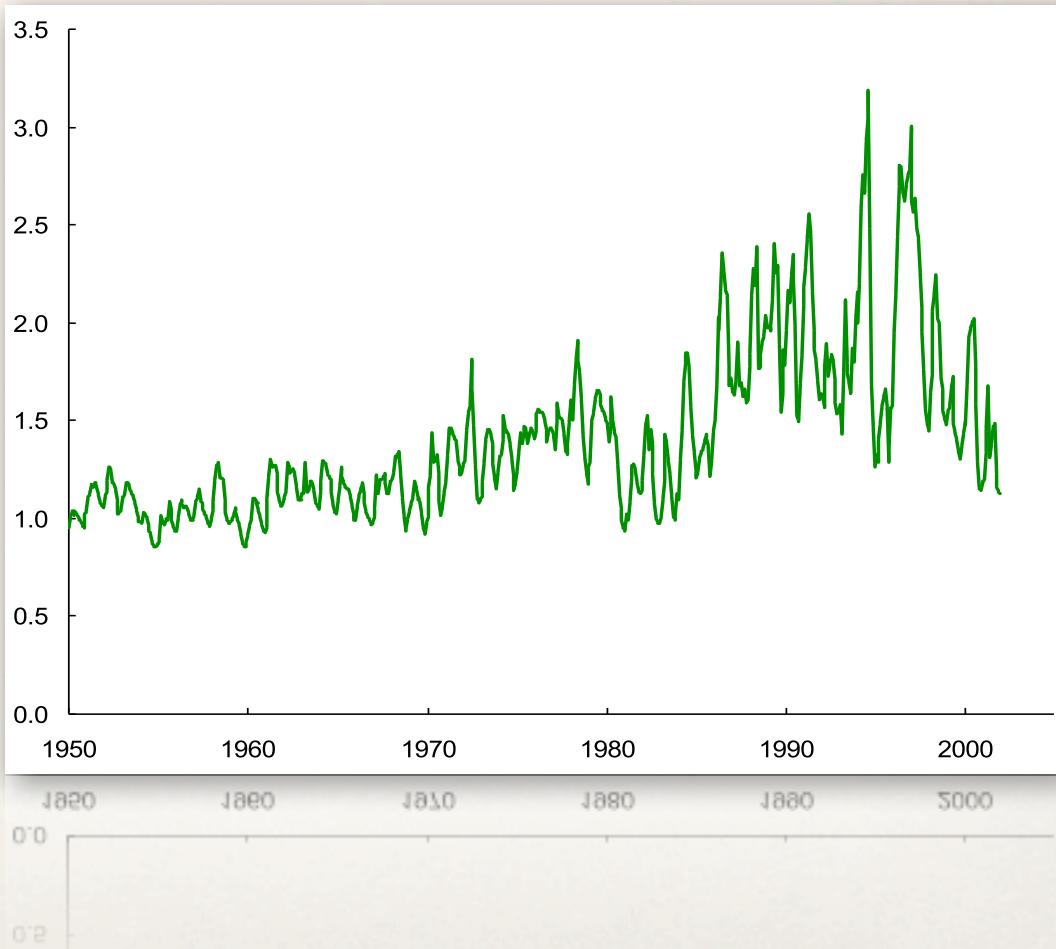

Oceanography and fisheries research

- ❖ A 70-year dispute: The Thompson-Burkenroad debate; who did it? The environment or the fisheries?
- ❖ Disconnect between oceanographic and fisheries research
 - ❖ Oceanography focuses on productivity and perhaps impact on zooplankton and fish eggs and larvae
 - ❖ Fisheries on dynamics of recruited fish populations
 - ❖ Focus on variability vs averages characteristic for both fields
- ❖ What do our fisheries 'bibles' have to say about environmental impact on fish populations?
 - ❖ Nothing. It is not of major concern for tactical management

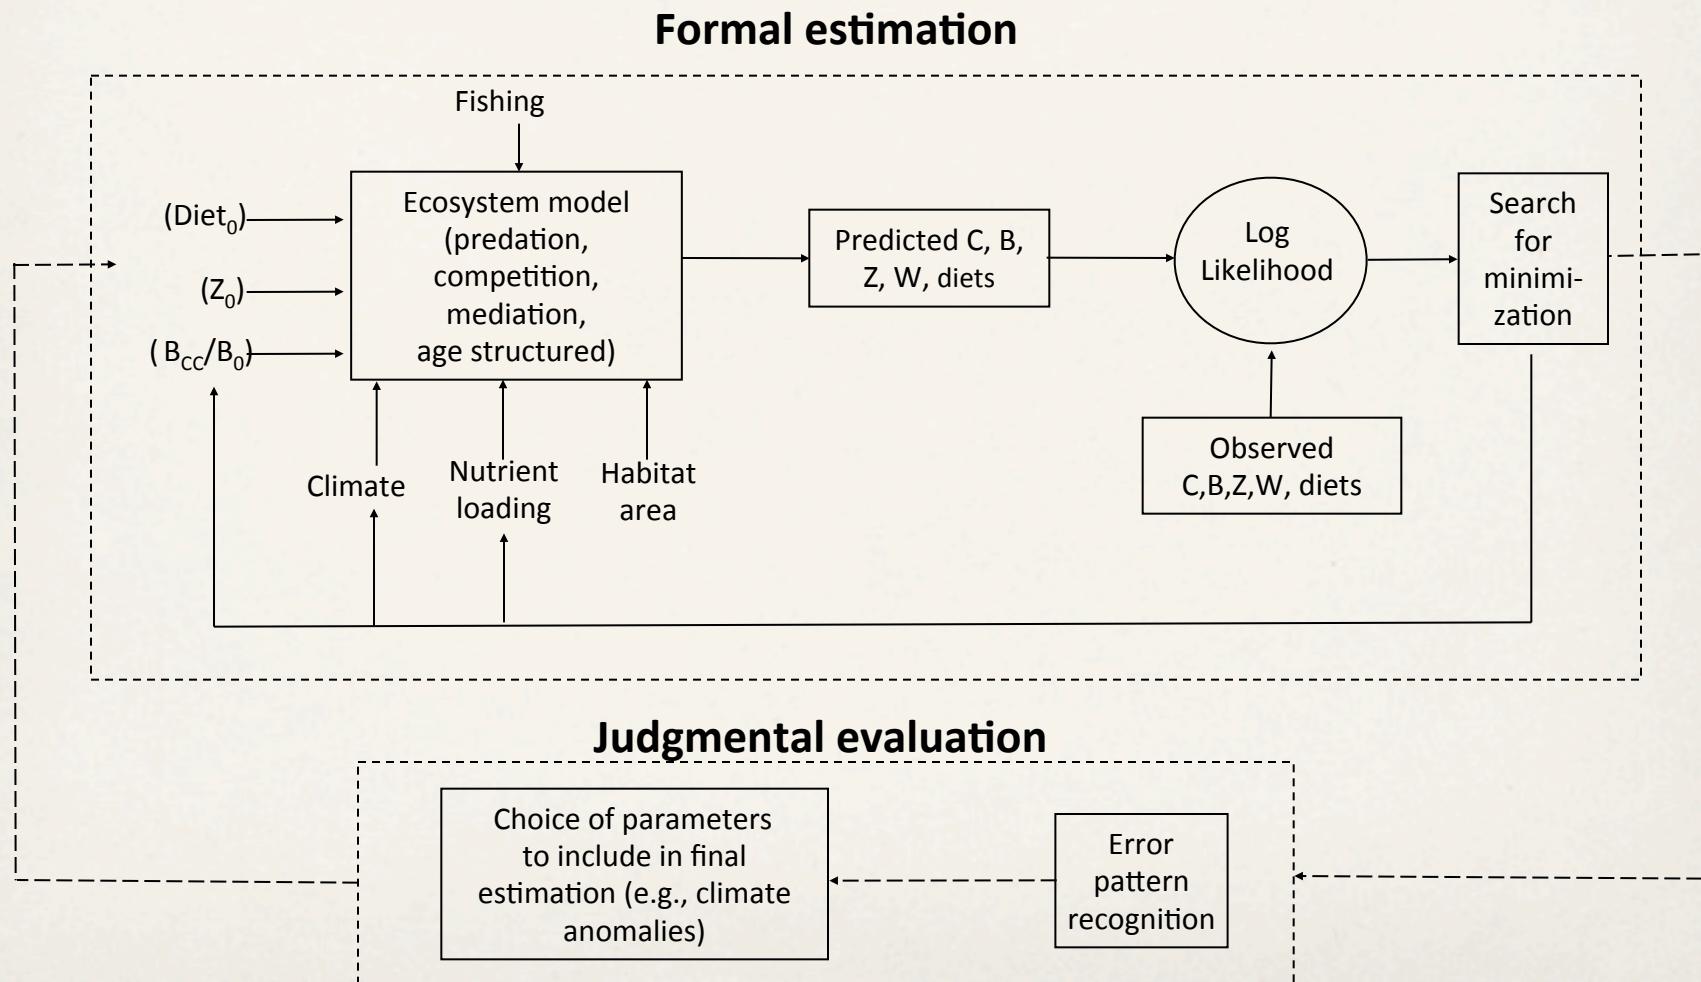

Environmental forcing in EwE

- ❖ Force nutrient supply
- ❖ Force primary production
 - ❖ or secondary, or any group
- ❖ Couple or link to hydrographic model
- ❖ Force temperature, salinity, O₂, pH, ...
- ❖ Long time series should be used for contrast

Modeling process: fitting & drivers

Time series fitting for ecosystems

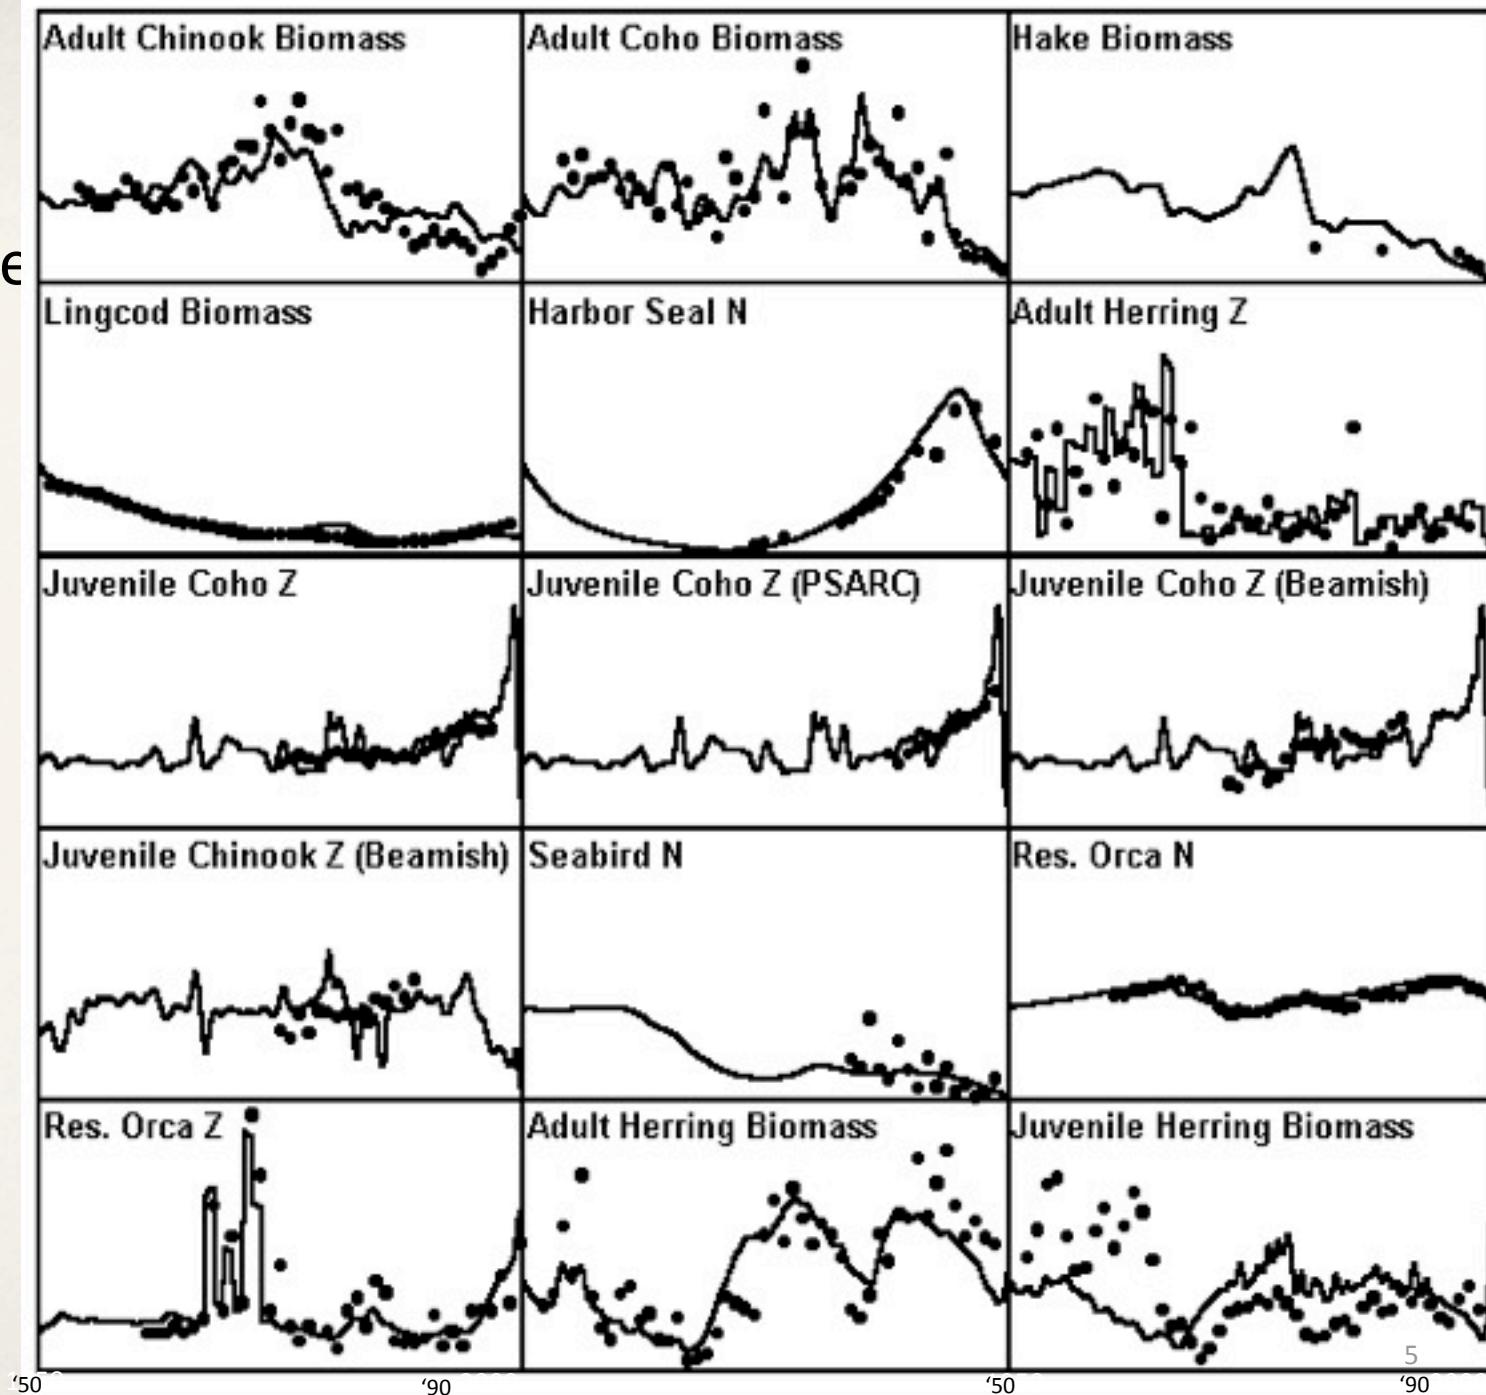

- ❖ Fitting calls for describing fisheries, food web, and environmental impacts
 - ❖ We can evaluate the relative impact of these factors

Are seals
causing fish
declines in the
Georgia
Strait?

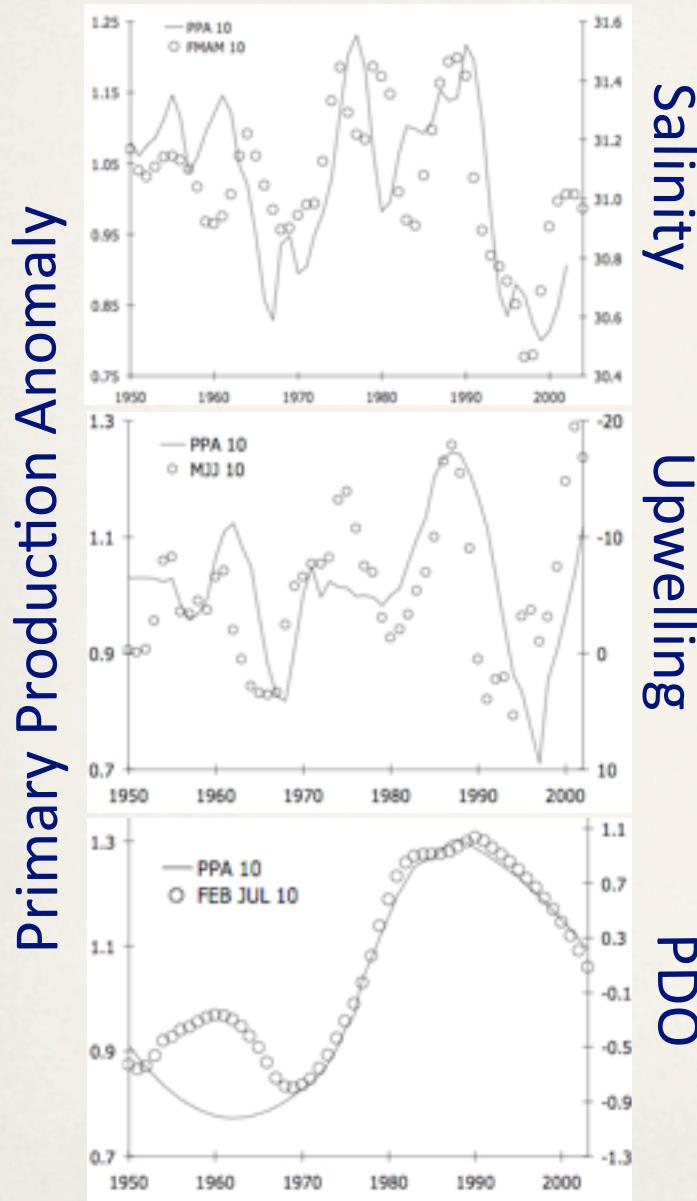

Is it fishing?

Is it environ-
mental
change?

Or, is it all
three?

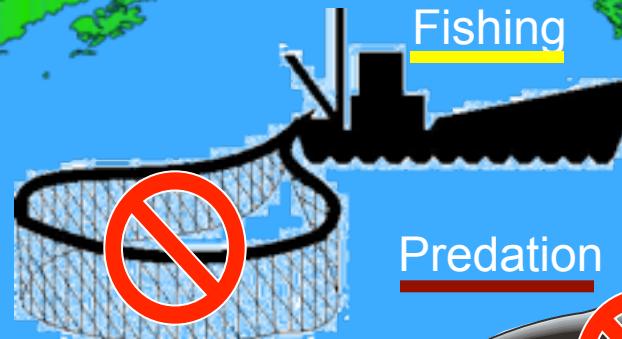

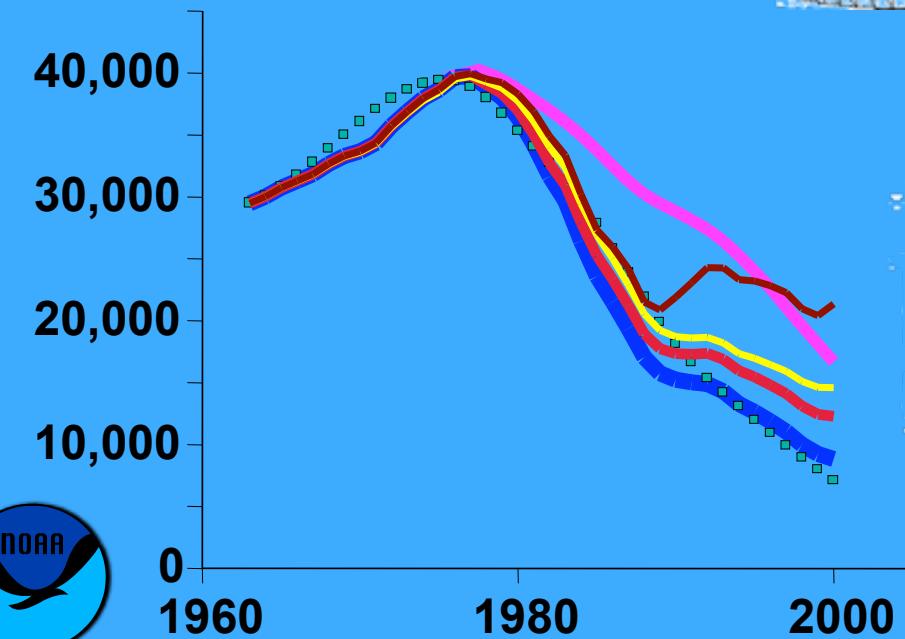

PP anomaly and climate indicators

- Strait of Georgia
 - Race Rocks Salinity, Feb-May
- BC shelf
 - Upwelling, May-July, 54°N
- NE Pacific
 - PDO, Feb-July

Alaska

Aleutian Islands

Fishing

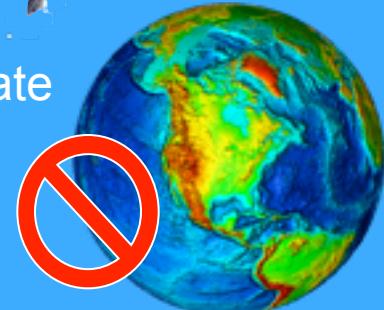

Predation

Competitive Interactions

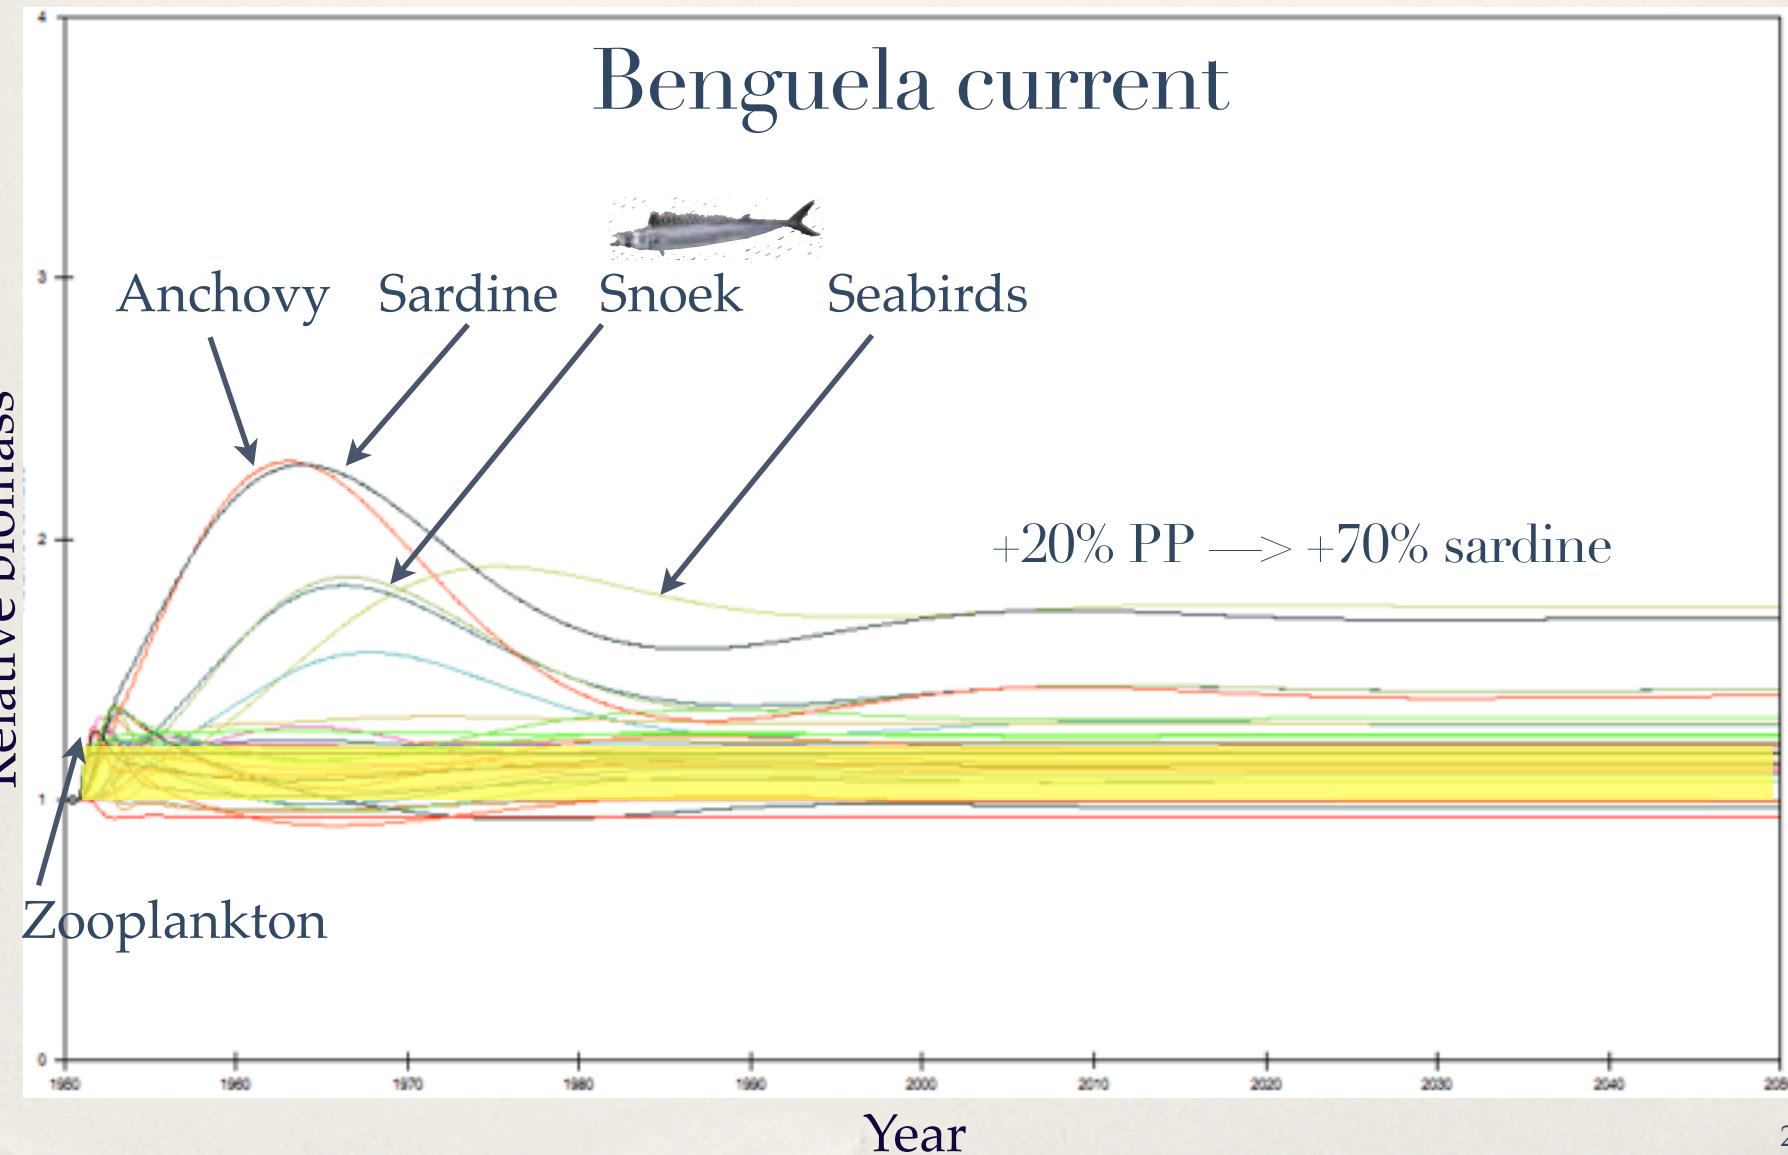

Ocean Climate Change

Lessons learned (40+ ecosystems)

- ❖ Ecosystem models can replicate historic changes in ecosystems and be used to evaluate the relative impact of fisheries, food web dynamics, and environmental change
- ❖ Fitting calls for evaluating food web, fisheries, and environmental impacts
- ❖ Changes in environmental productivity are often amplified through the food web:

What happens in the food web?

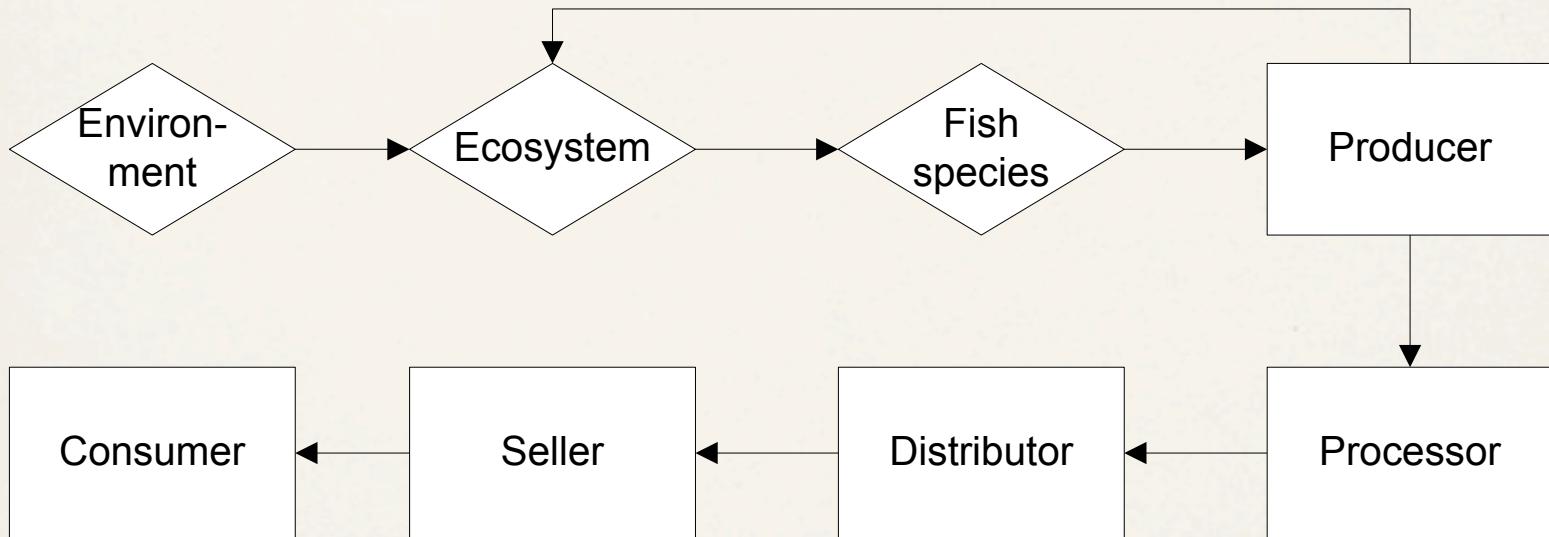

Amplification thru the food web

- ❖ What causes amplification?
 - More food results in surplus beyond maintenance that can be allocated to growth and reproduction
- ❖ Modeling key factor: can the predator increase its food intake?
 - Correlates with density-dependent factor, which explains 20-80% of variation
 - Also modified by food web, notably prey availability
- ❖ Modeling artifact?
 - Not likely
- ❖ Consequence?
 - Ecological impact is not necessarily a linear function of habitat impact

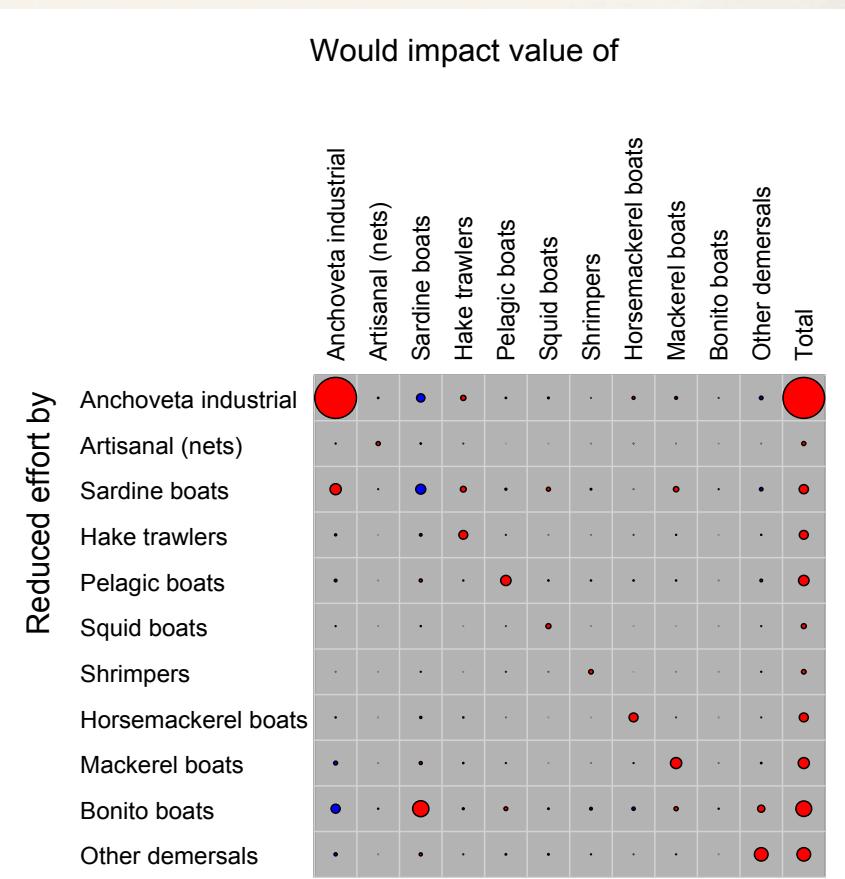

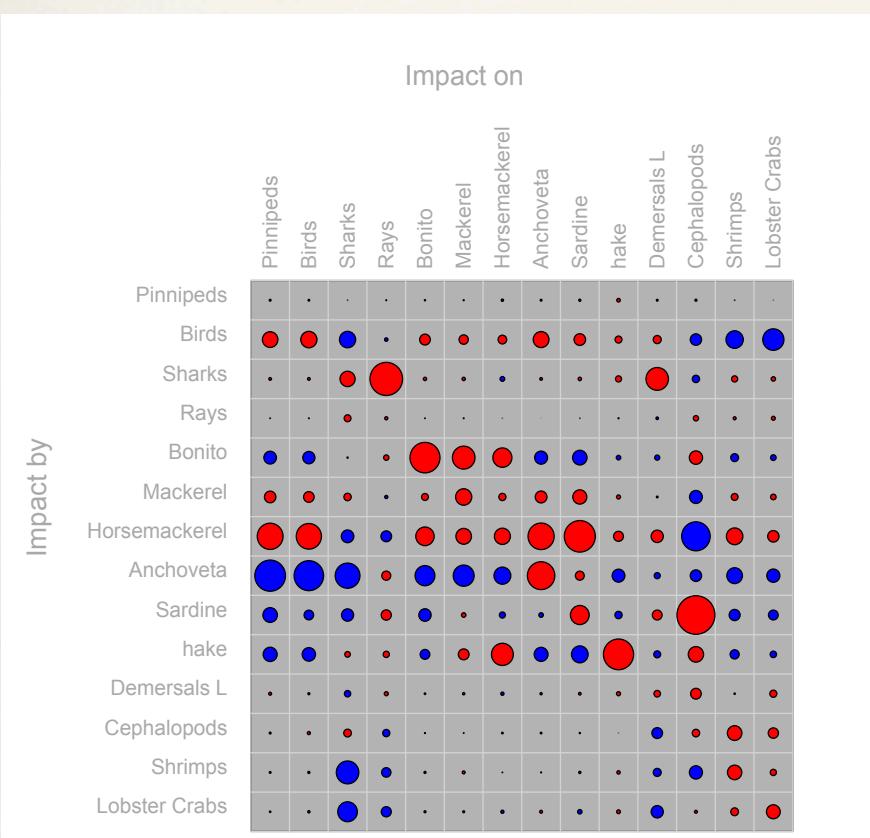

We model from sea to plate

- Consider ecological, social, and economic consequences (and drivers)

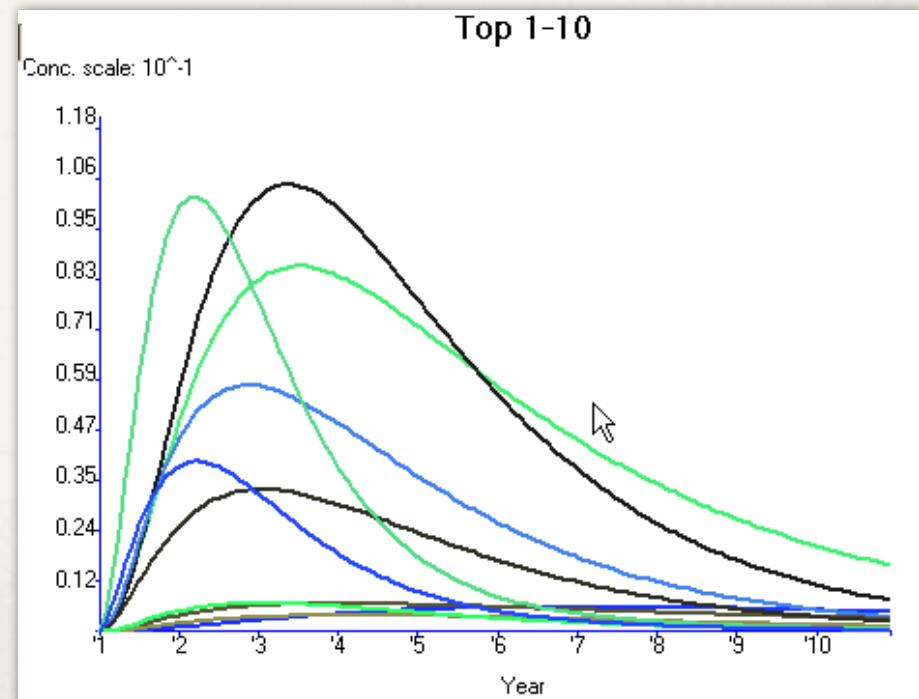

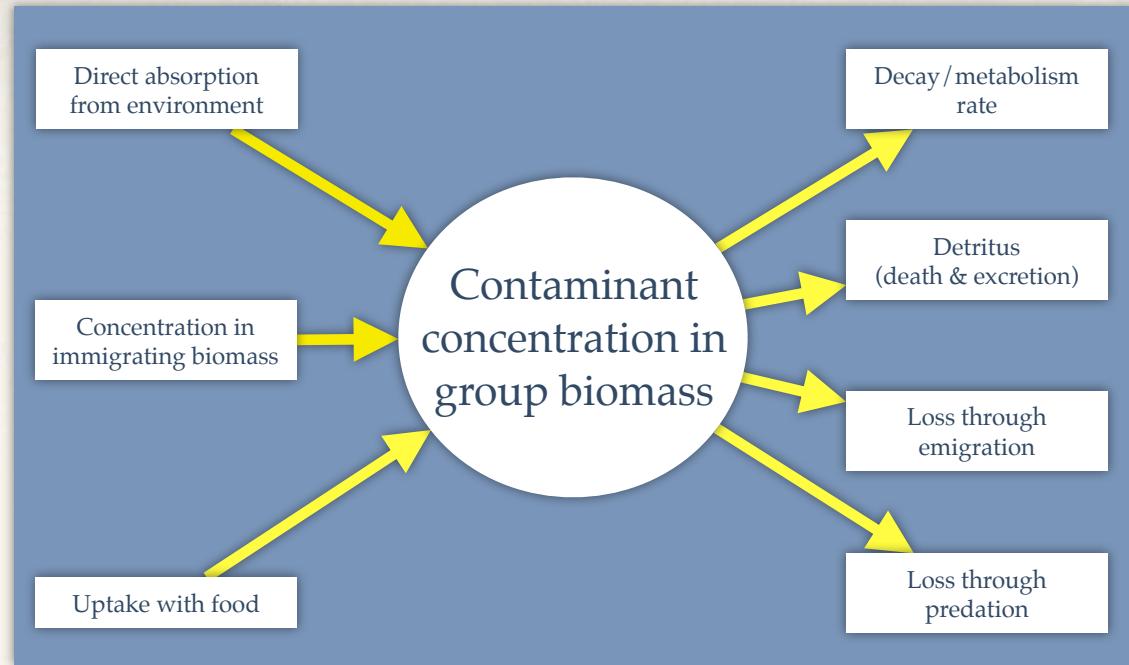

Evaluating trade-offs

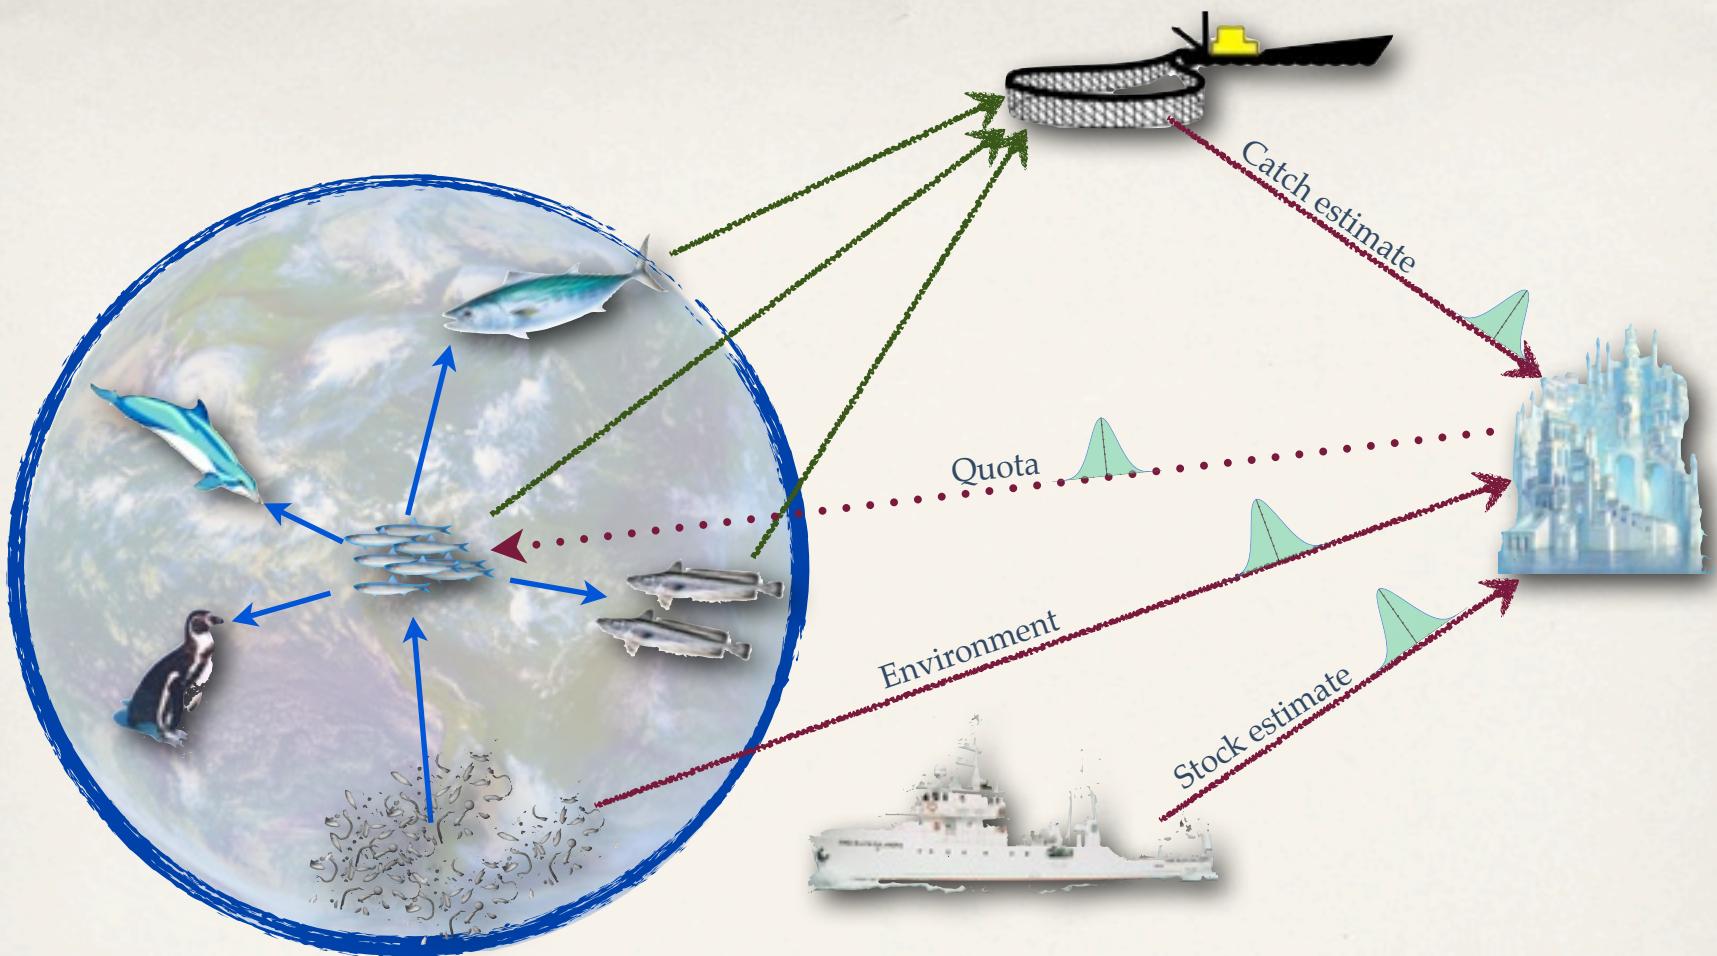

- ❖ Ecological (“Mixed trophic impacts”)

Tracking persistent pollutants: (Ecotracer)

- ❖ Integrated in EwE
 - ❖ Parallel simulation, tracking flow of pollutant through the food web
 - ❖ Quantifies bio-accumulation and bio-magnification
 - ❖ Pollutant concentration can impact productivity of the group

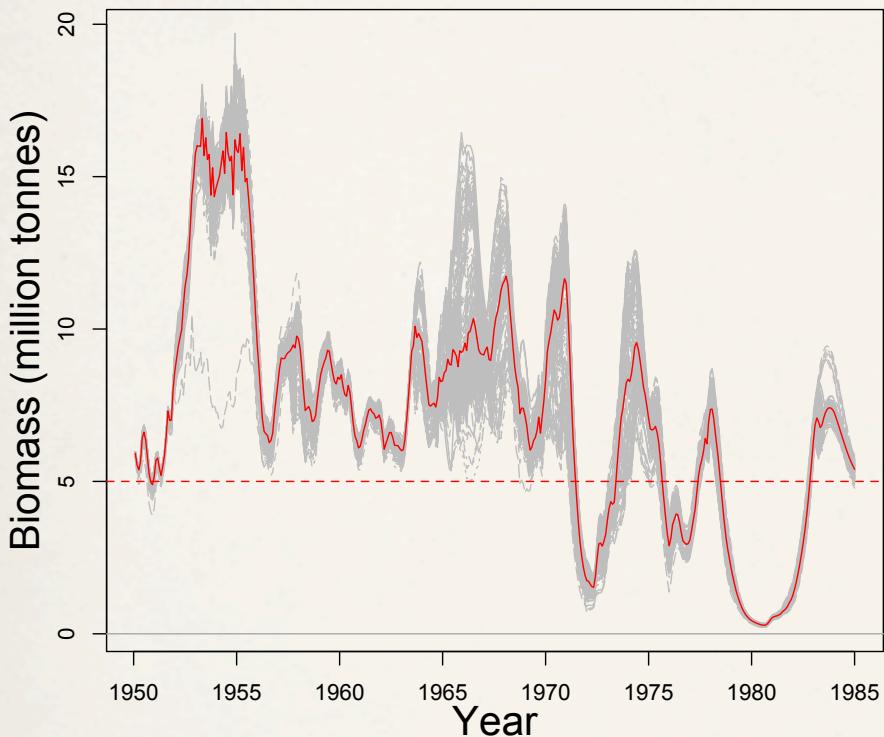

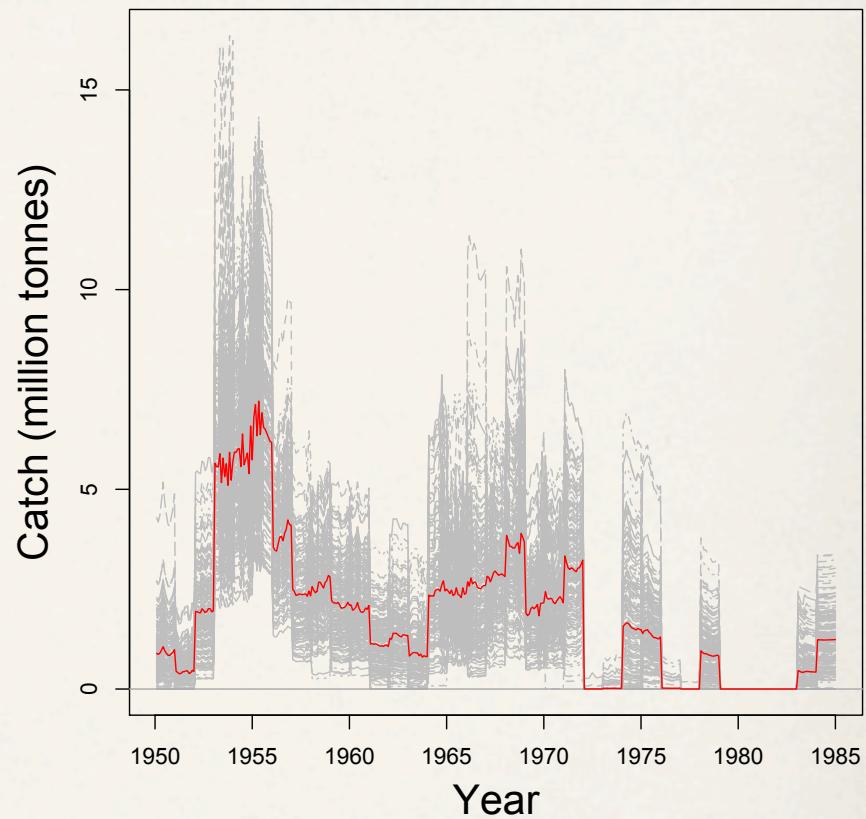

Management Strategy Evaluation

Evaluate how uncertainty impacts fish stocks and the fishing industry

Biomass

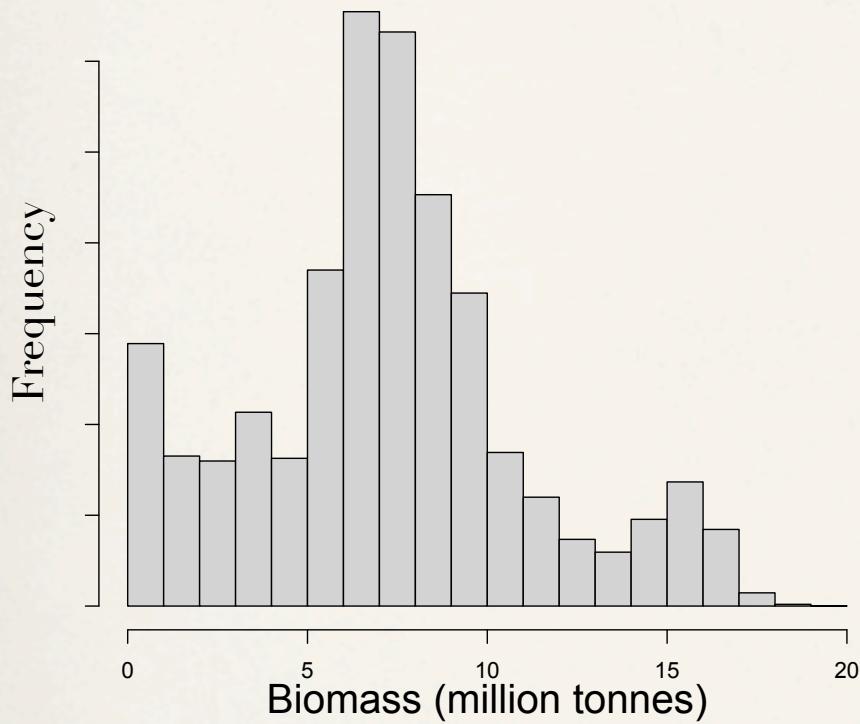

Catch

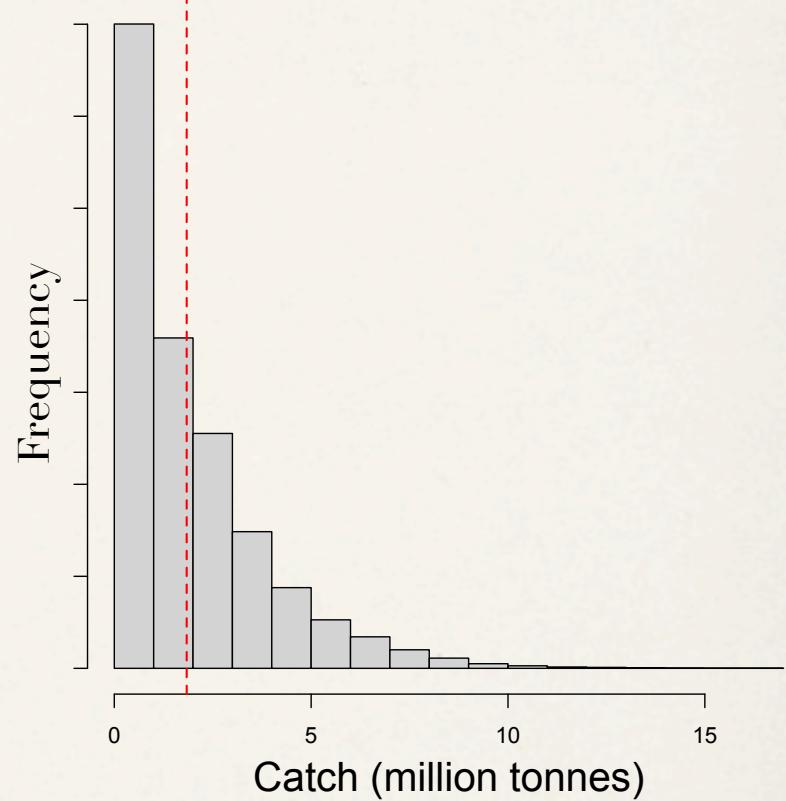

Quota system (>5 mill. t)

Biomass

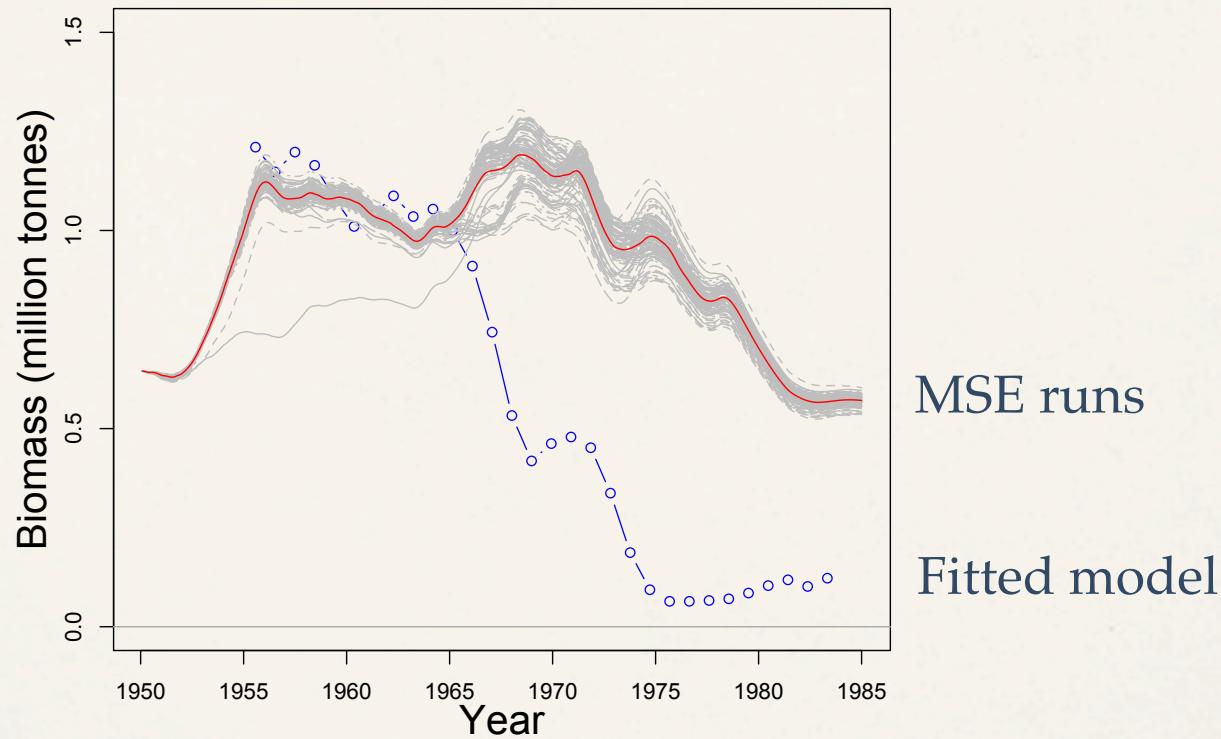

Catch

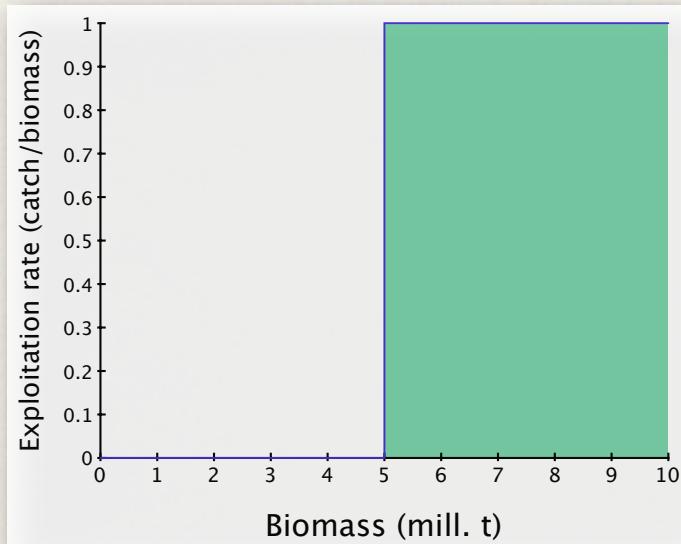

Quota system (>5 mill. t)

Bonito

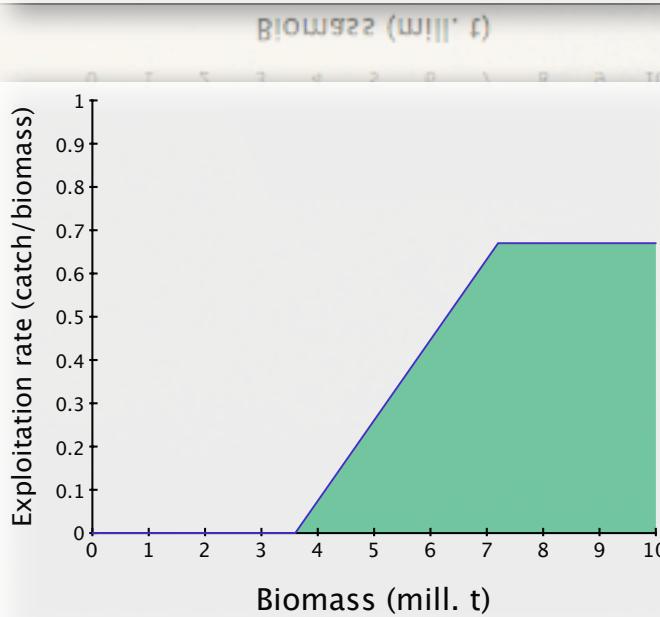

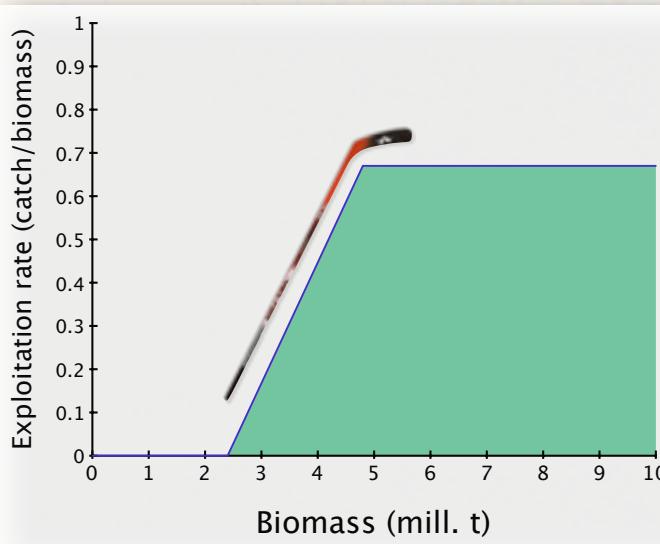

Quota system (escapement 5 mill. t)

Alternative quota procedures

High average catches

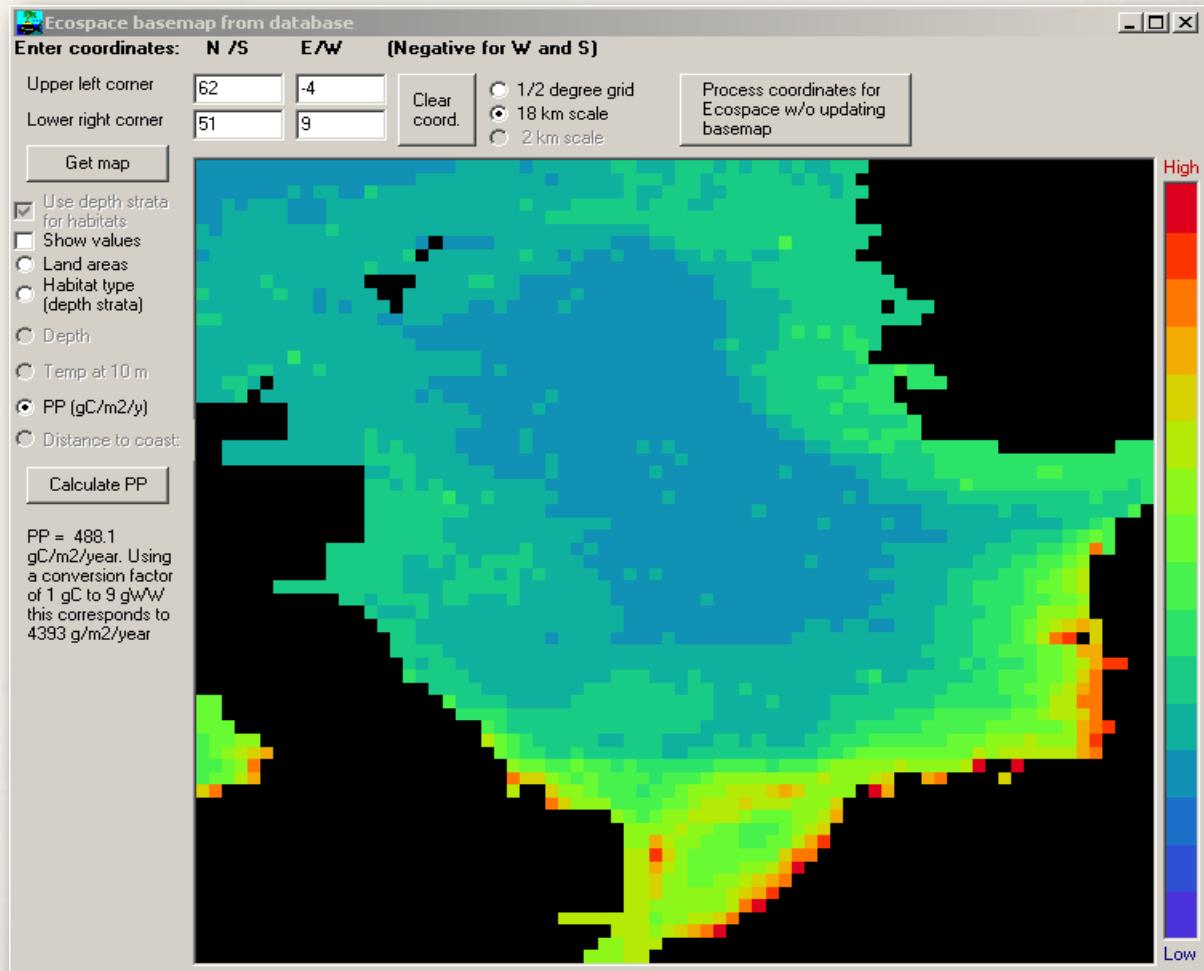

Low variability in catches

Spatial model (Ecospace)

Links to:

- ❖ Spatial databases for PP, depth, T, habitat structures, ...
- ❖ FishBase and Sea Around Us for occurrence, depth dist., catches, ...
- ❖ Zoning use

EwE modeling integrates many spatial layers

Policy & awareness

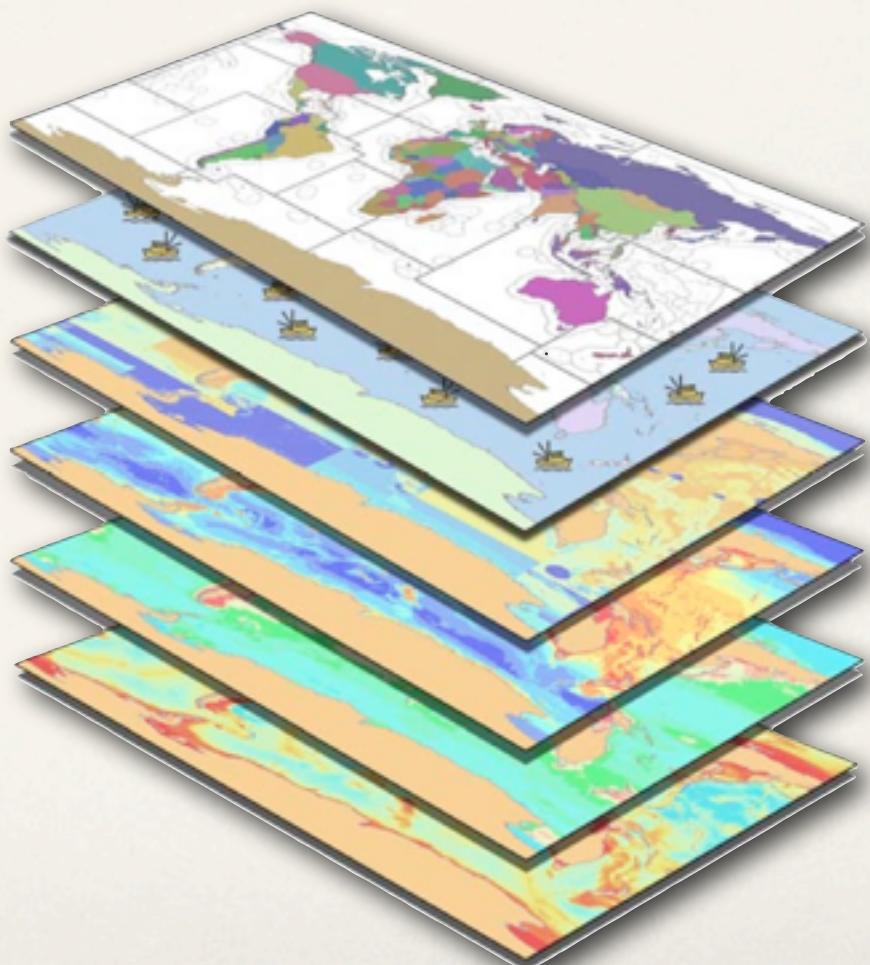

Economy & social

Seafood

Biodiversity

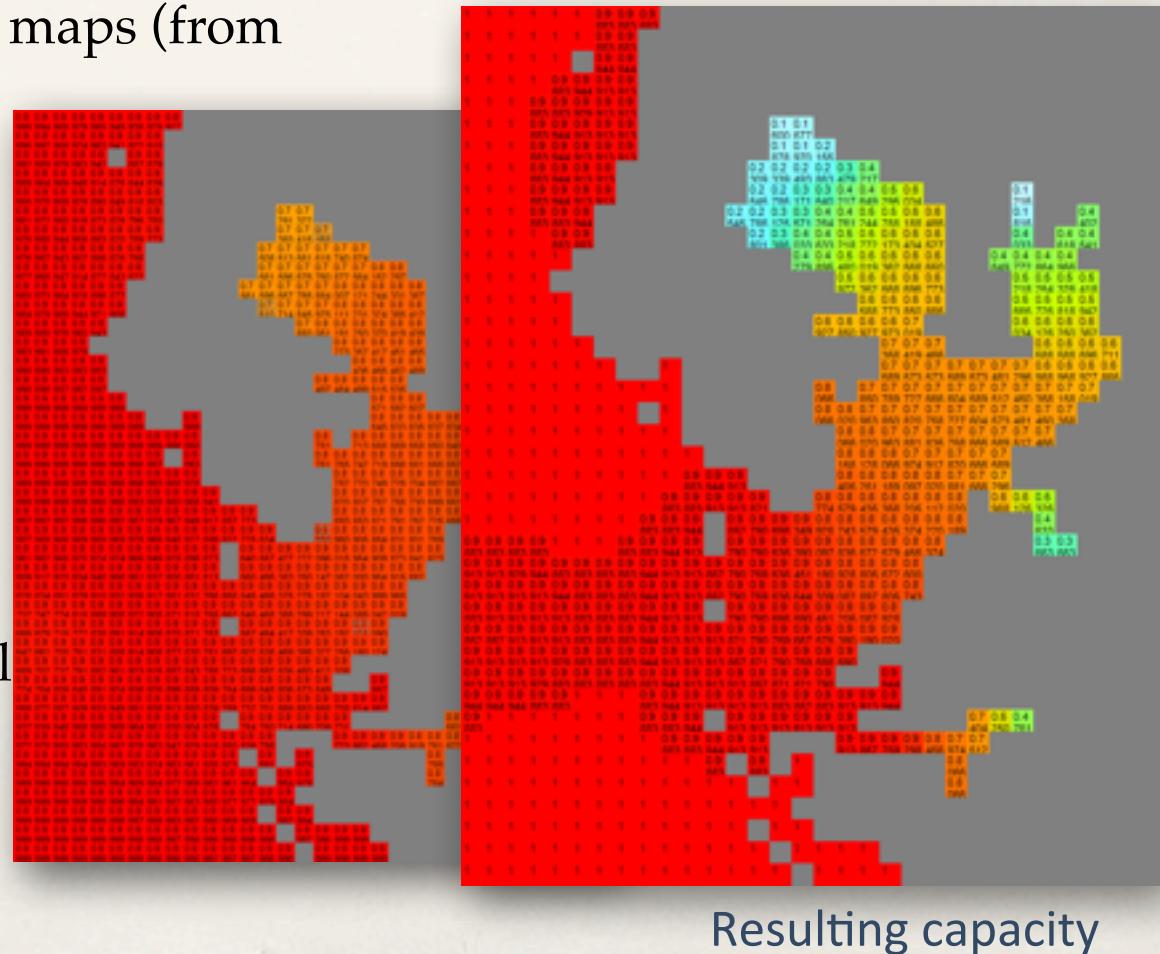

Productivity

Climate & currents

Habitat capacity modeling in EwE

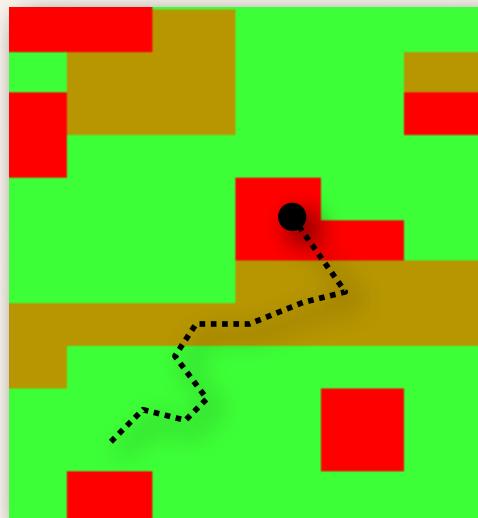

- Reads environmental maps (from GIS and NetCDF)
- Spatial cells have properties for different habitat types, e.g., %hard bottom
- Dynamic habitat model predicts how productive individual cells are for each species

Ecospace IBM representation

State of each packet over time is represented by:

- X,Y position (spatial cell)
- Number of fish
- Mean body weight
- Age (stanza)

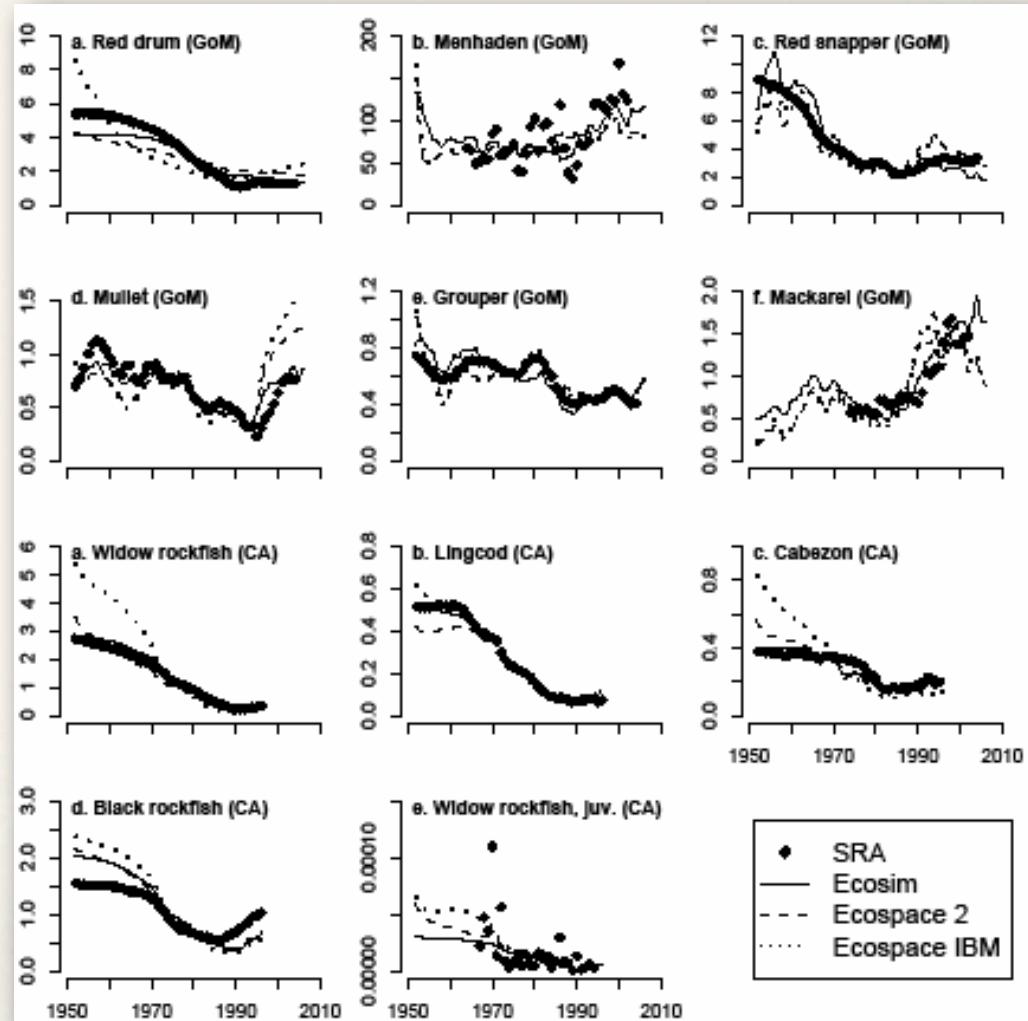

Spatial cells encountered by the packet vary in:

- habitat type
- prey densities
- predation risk
- fishing effort

Movement rules include random direction change (diffusion), oriented seasonal migration movement, and fitness gradient moves (toward cells with higher fitness as measured by the ratio (food availability)/(predation risk))

Ecosim, Ecospace (& IBM) give similar time predictions and fits to historical data

- Fits to historical stock reconstructions (SRA) and abundance trend indices for selected species, Gulf of Mexico and central California coast.

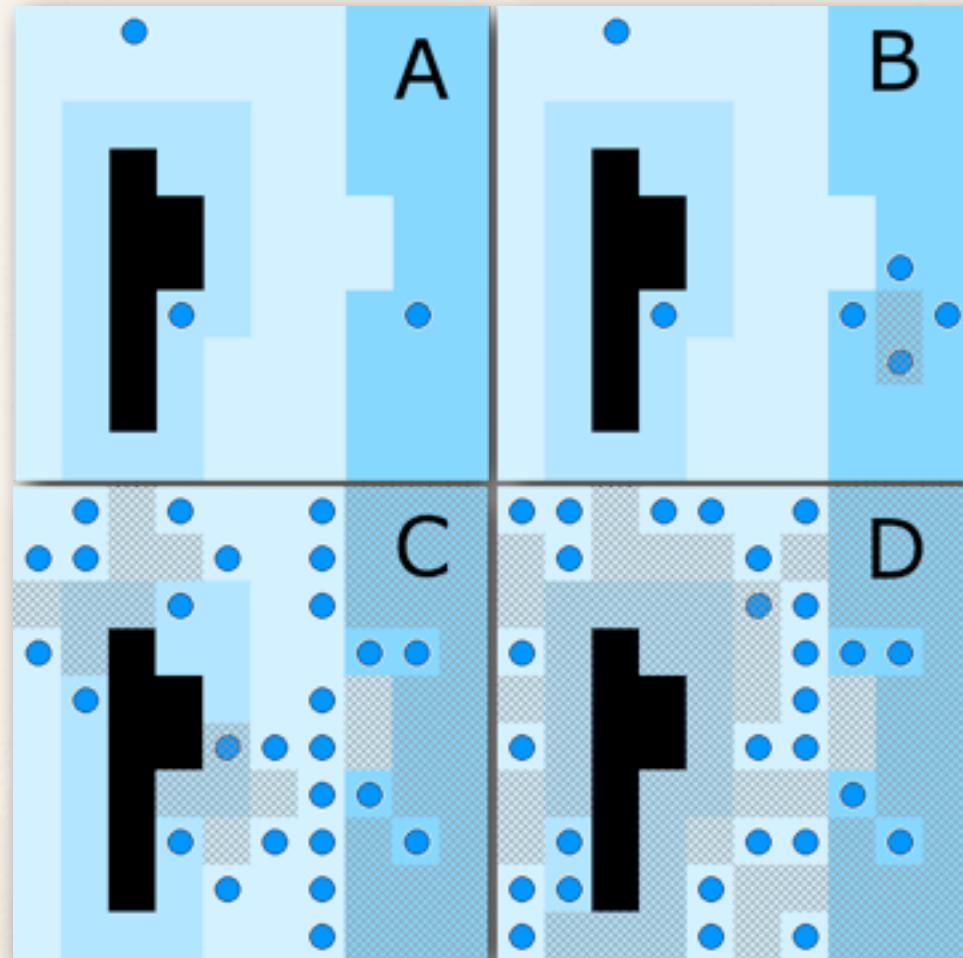

Spatial optimization

- ❖ New module in Ecospace with two approaches for optimization
 - 1. Ecoseed
 - 2. Importance layers

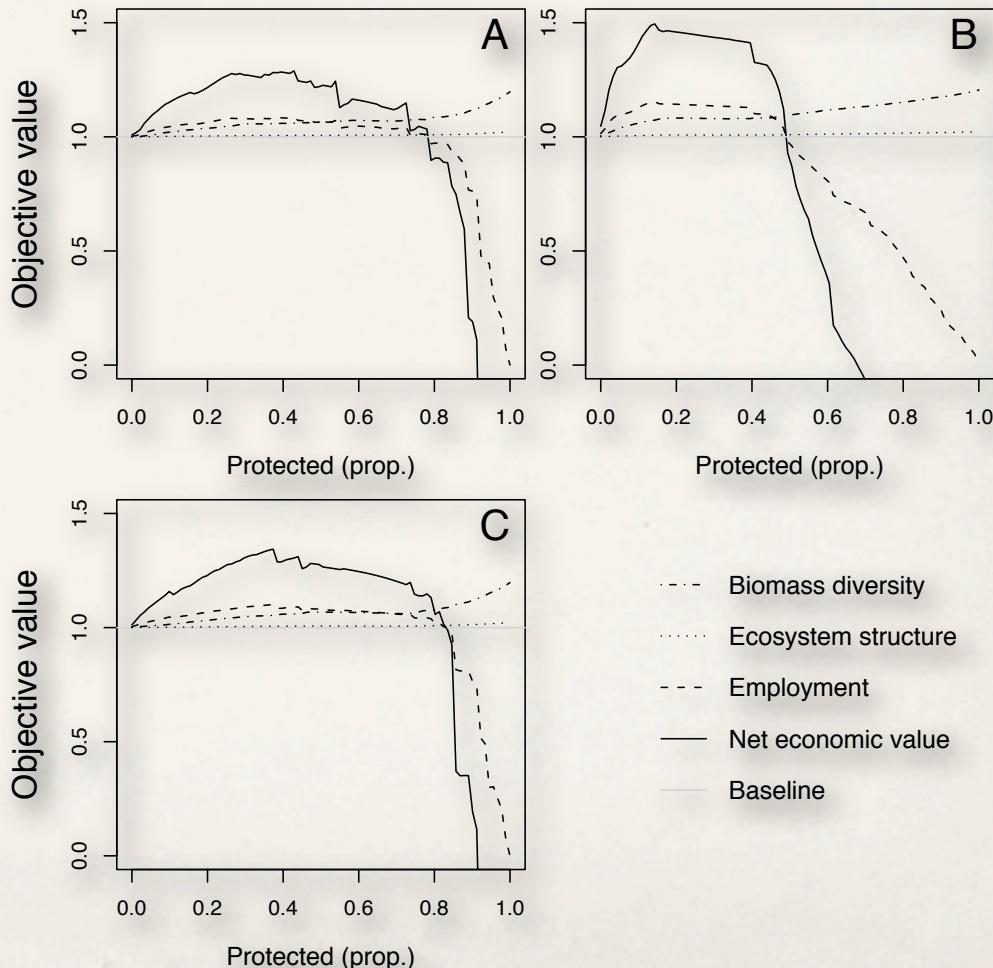

Ecoseed

- Start by selecting a number of 'seed' cells, i.e. potential cells to for protection
- Define an objectivity function (same parameters as for policy search)
- Run routine; will cover the map and evaluate trade-offs

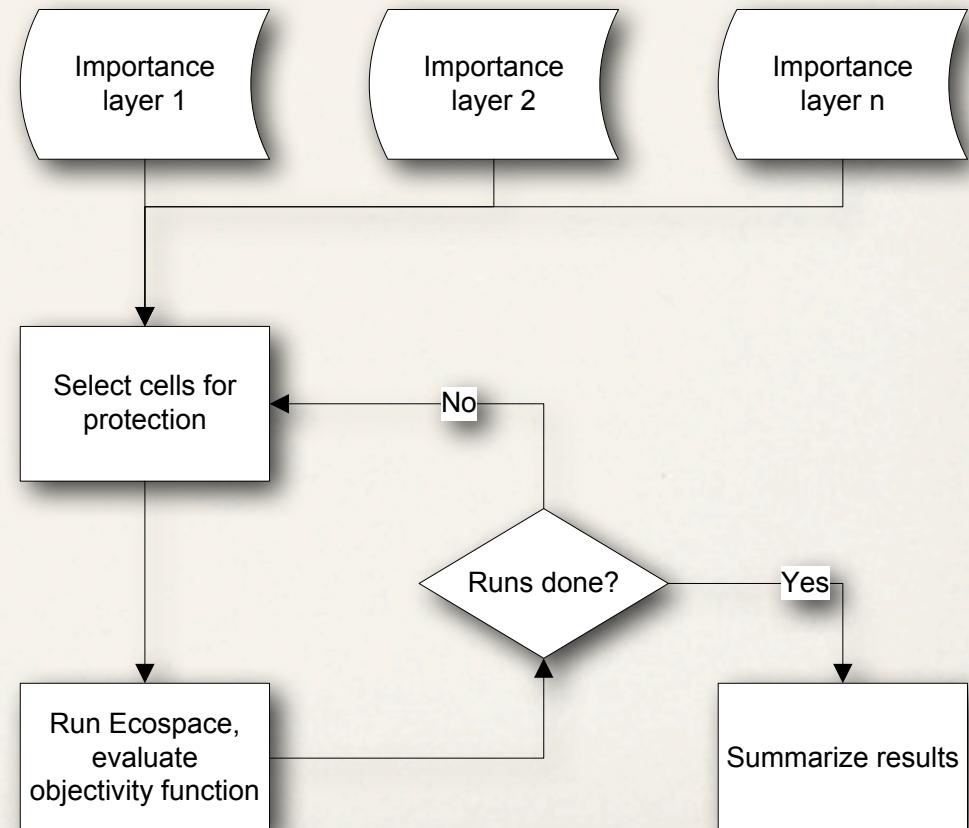

Ecoseed results

- ❖ Objectivity function values (Y-axis, relative) against proportion of area closed to fishing (X-axis) based on seed cell selection.
- ❖ Target species dispersal rate is $300 \text{ km} \cdot \text{year}^{-1}$ (A, C), and $30 \text{ km} \cdot \text{year}^{-1}$ (B).
- ❖ Initial number of seed cells is 3 (A, B) or all cells (C).

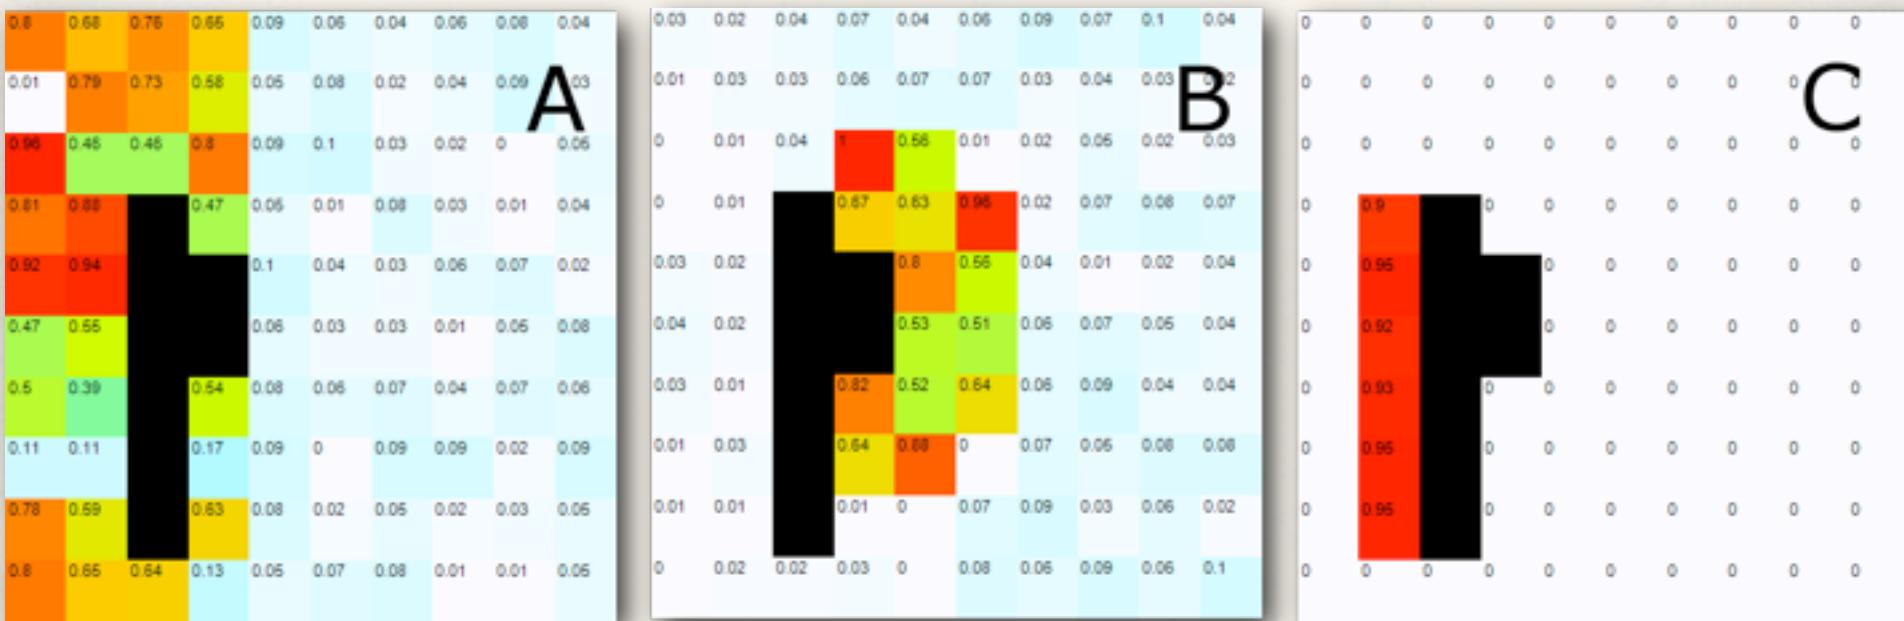

Importance layers

- Uses importance layers similar to MARXAN

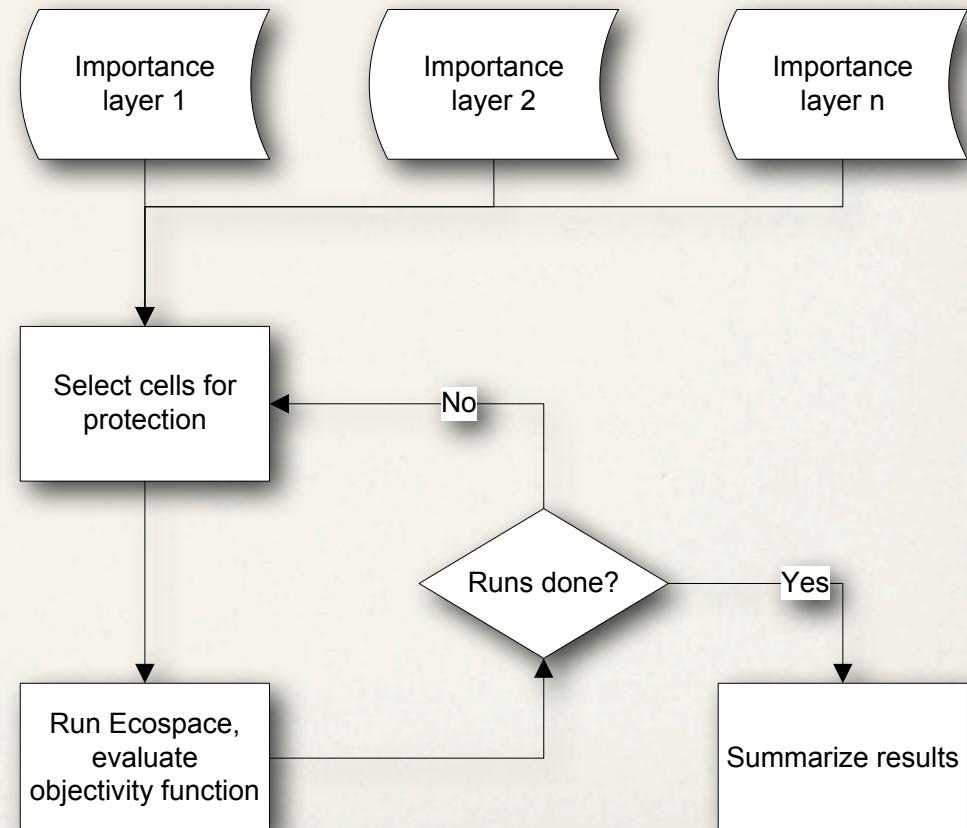

Importance layers

- Assign importance weighting factor to each layer

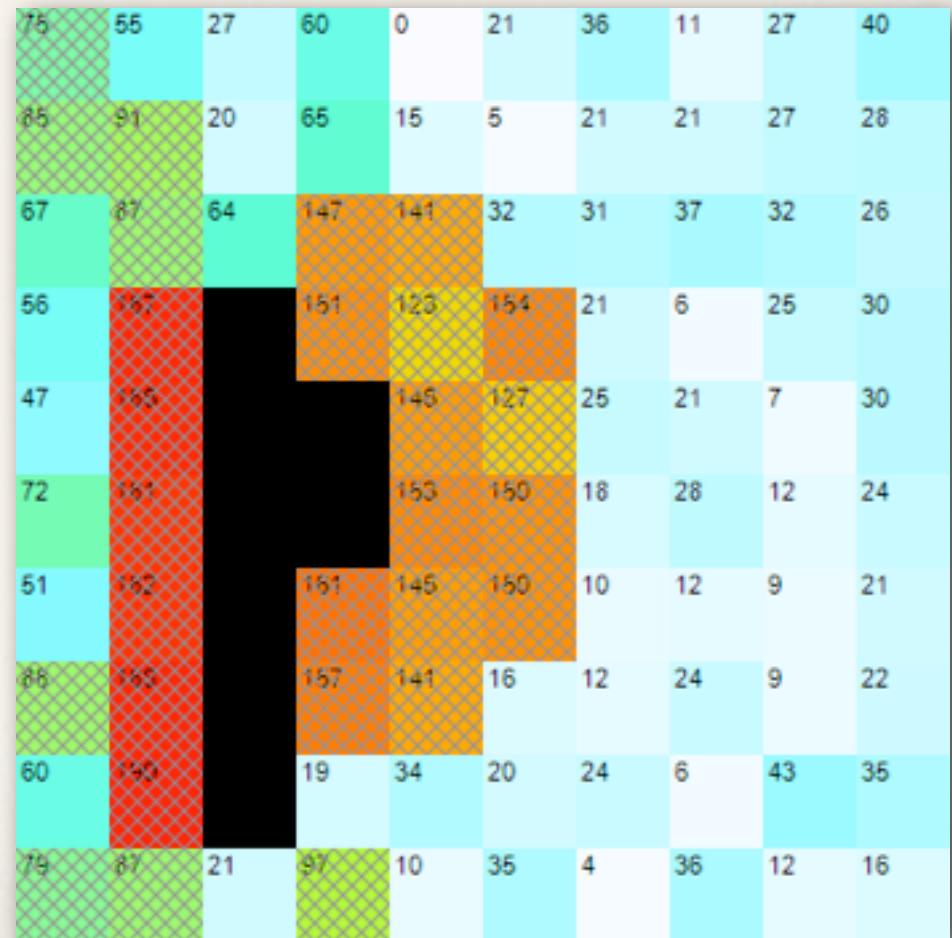

Importance layers

- Uses importance layers similar to MARXAN

Importance layer results

- ❖ Basemap from importance layer sampling with 20,000 runs, selecting the run with the top 1% objectivity function values.
- ❖ Number sand shading (light=low; dark=high) indicate how many times each cell was included in the best runs, with the hatched cells being the 30% with highest count, that would be prime targets for protection.

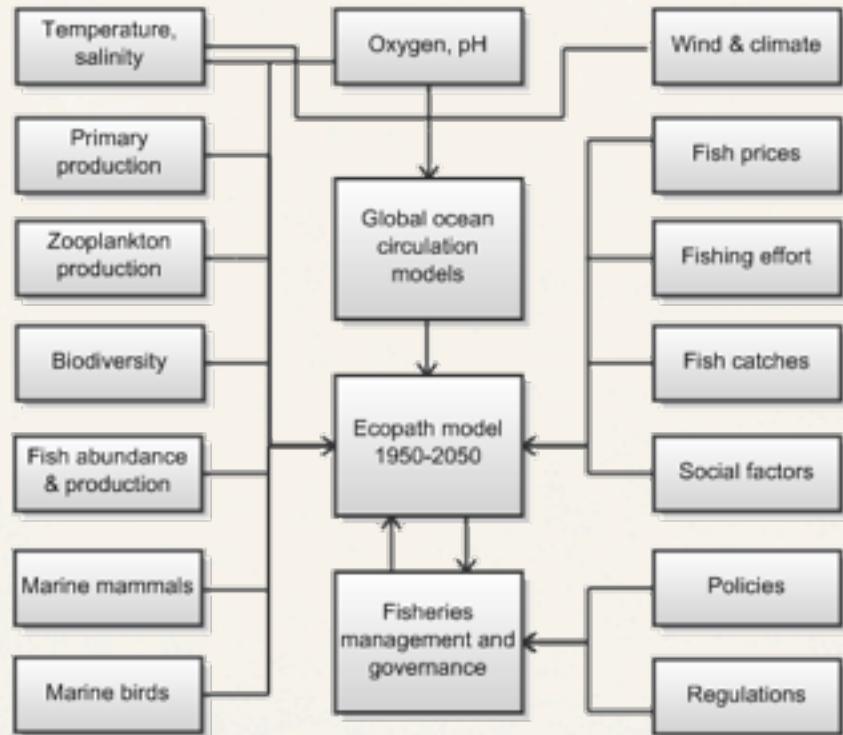

NEREUS

PREDICTING THE FUTURE OCEAN

Will there be fish for coming generations?

- ❖ Fisheries have collapsed across the globe linked to overcapacity of fishing fleets
- ❖ Predictions of future fisheries are dire, but build on very incomplete science
- ❖ The NF-UBC Nereus program is an international, interdisciplinary, cooperative research network designed to improve predictions, linking science - policy - people

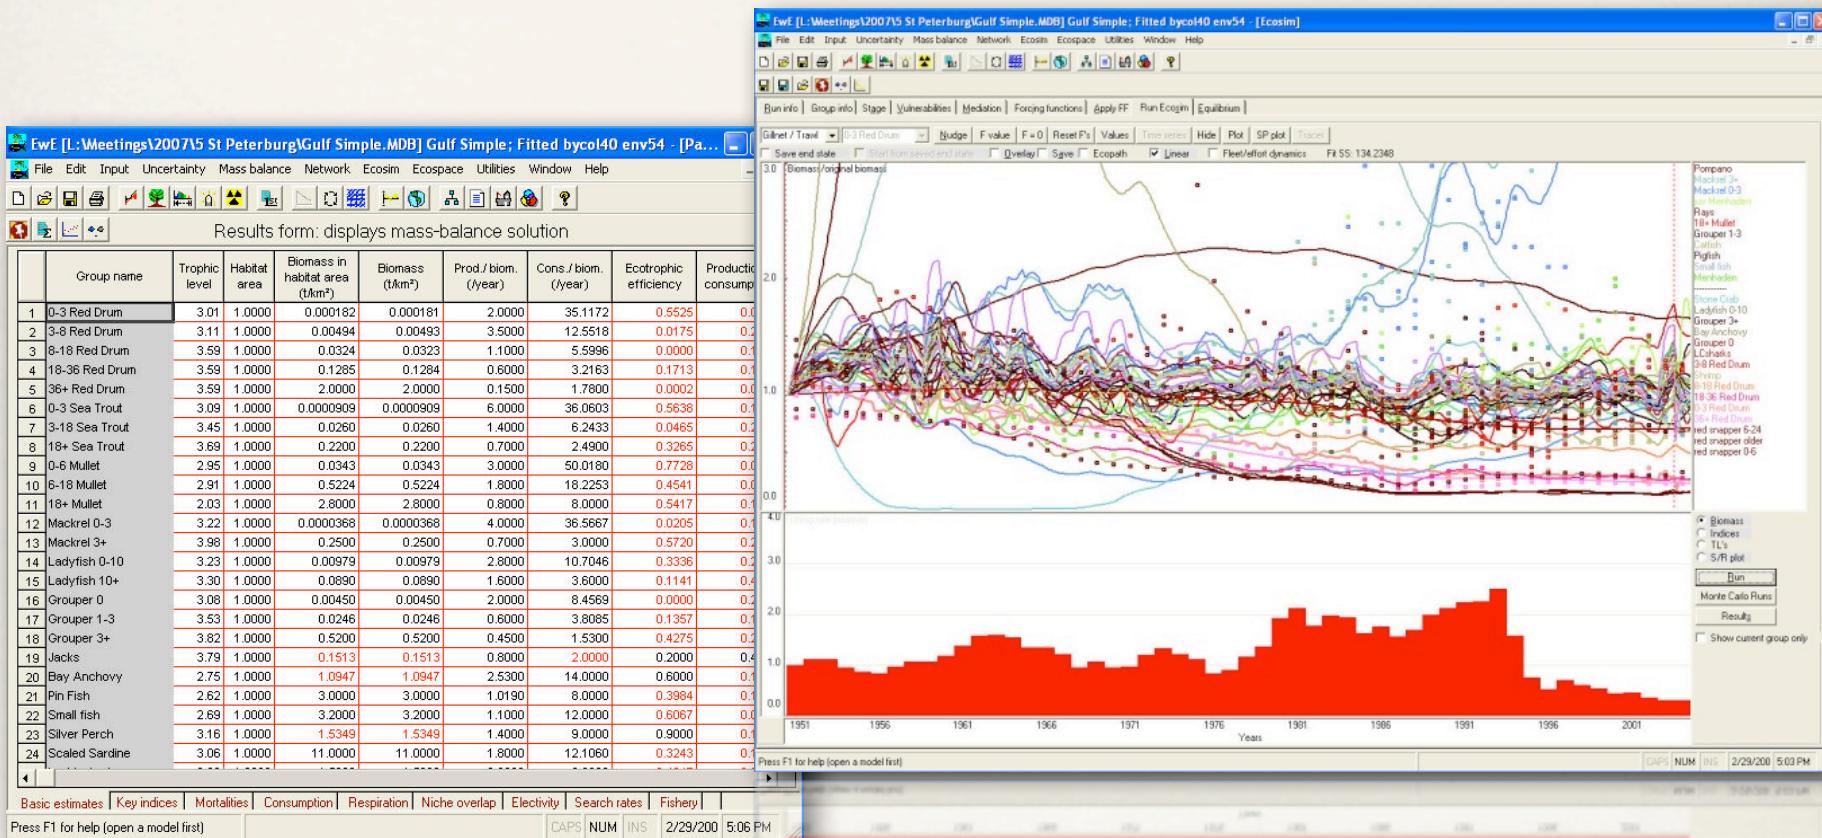

Simulating the Future Ocean

Integrated ecosystem analysis

Communicating the science

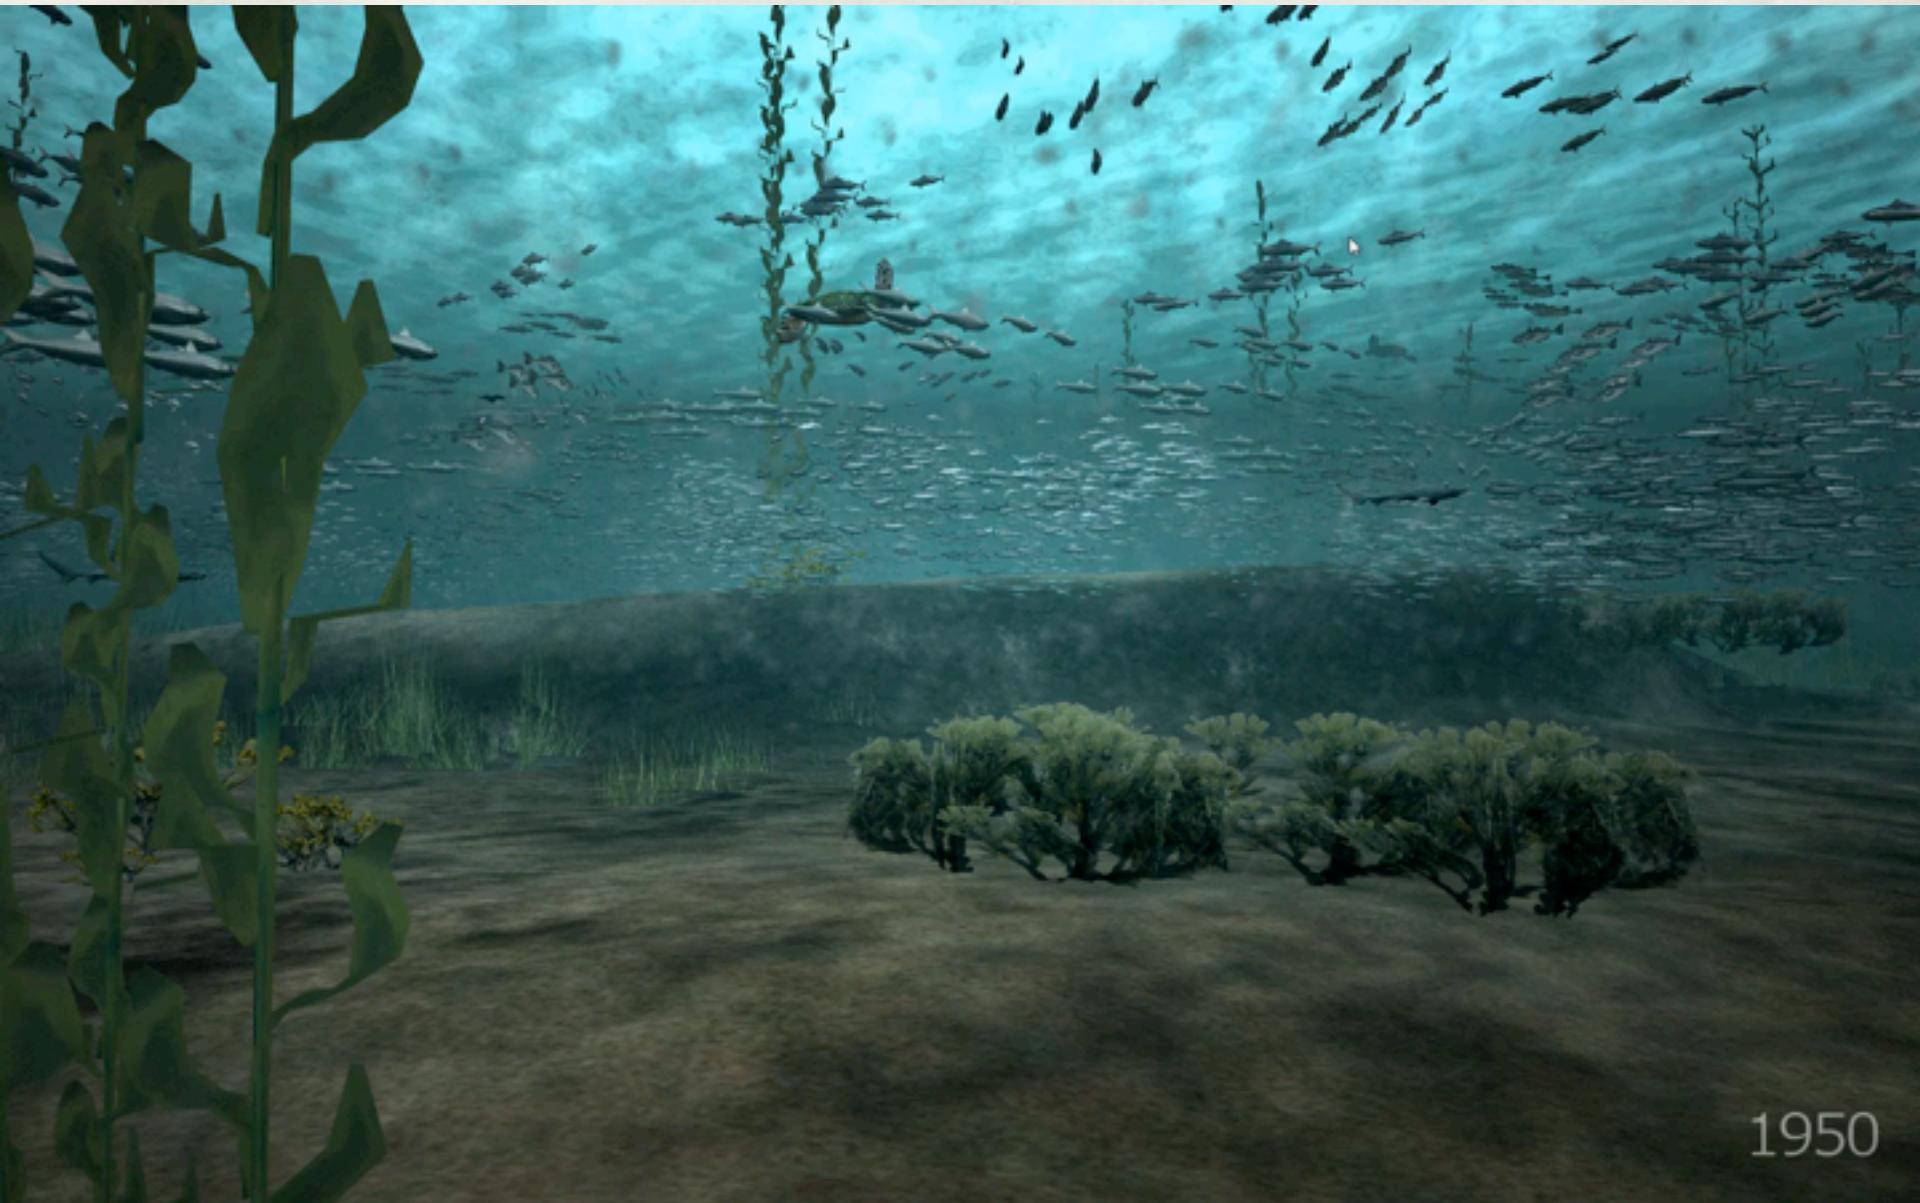

We're good with spreadsheets and graphs

But ...

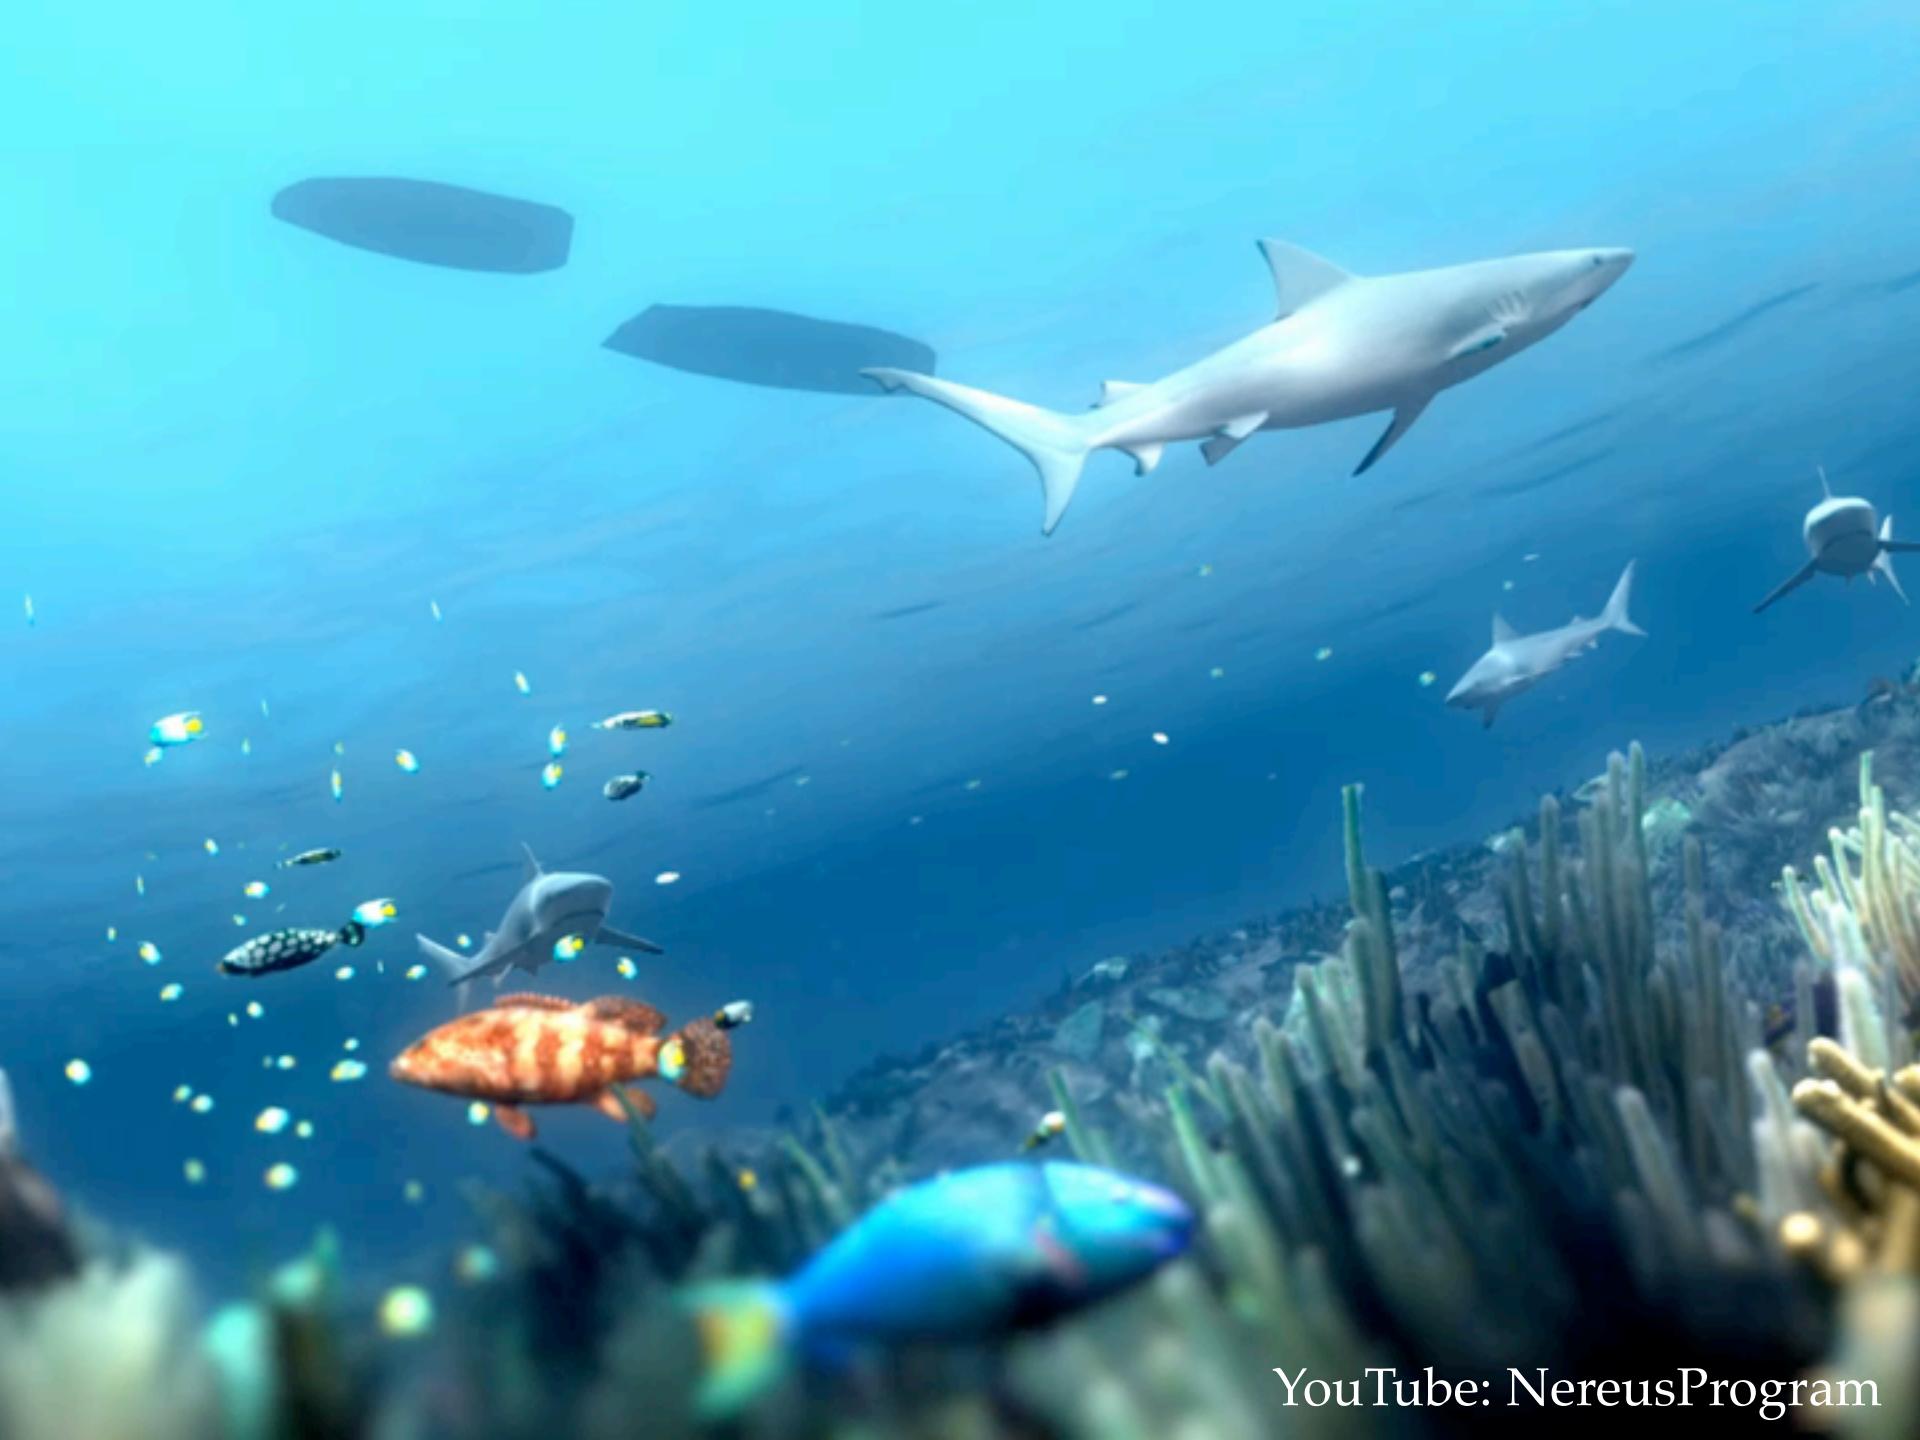

But the players are not scientists

- ❖ How do you make the new Minister of Finance understand that selling licenses to foreign fleets or giving subsidies to increase the national fishing capacity may lead to lower catches, less income, and social unrest?
